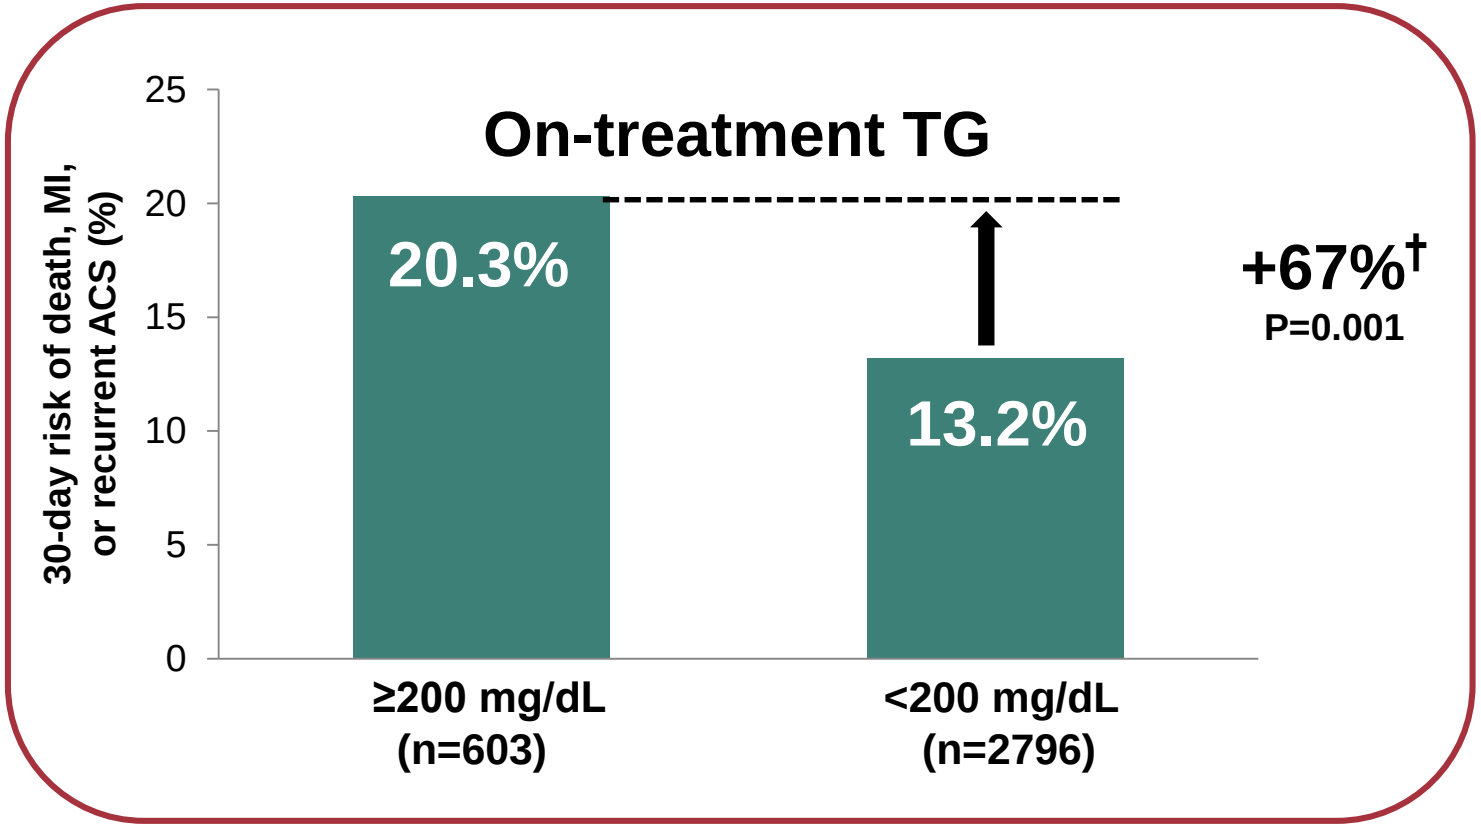
[7]Ridker PM et al. *N Engl J Med*. 2008;359:2195-207.

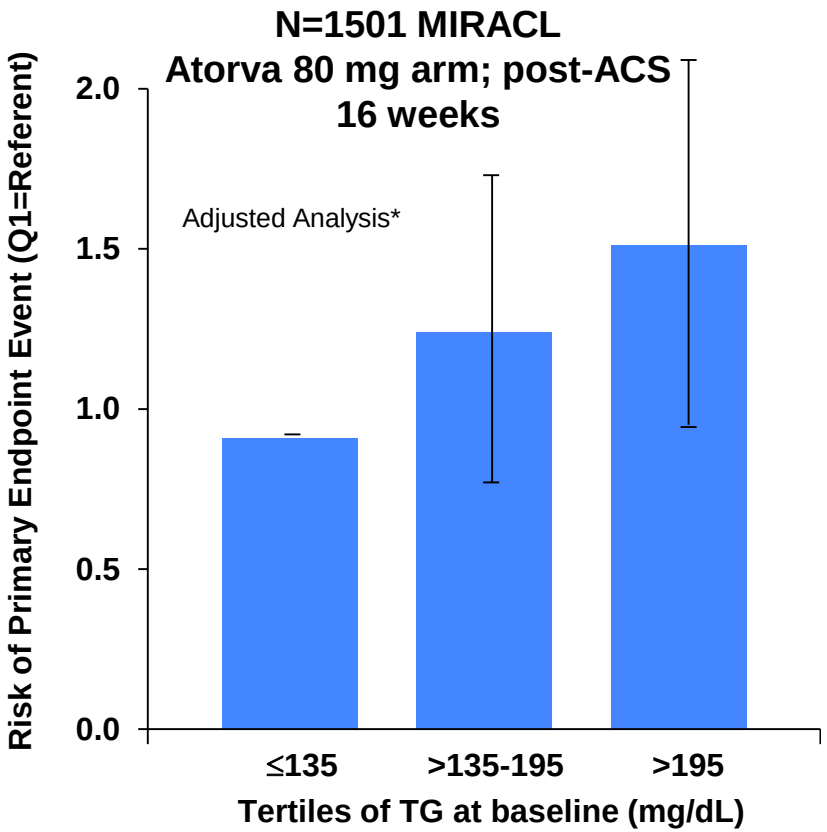
PROVE IT-TIMI 22: Elevated TG Levels Increase Risk of a Coronary Event, Despite LDL-C at Goal

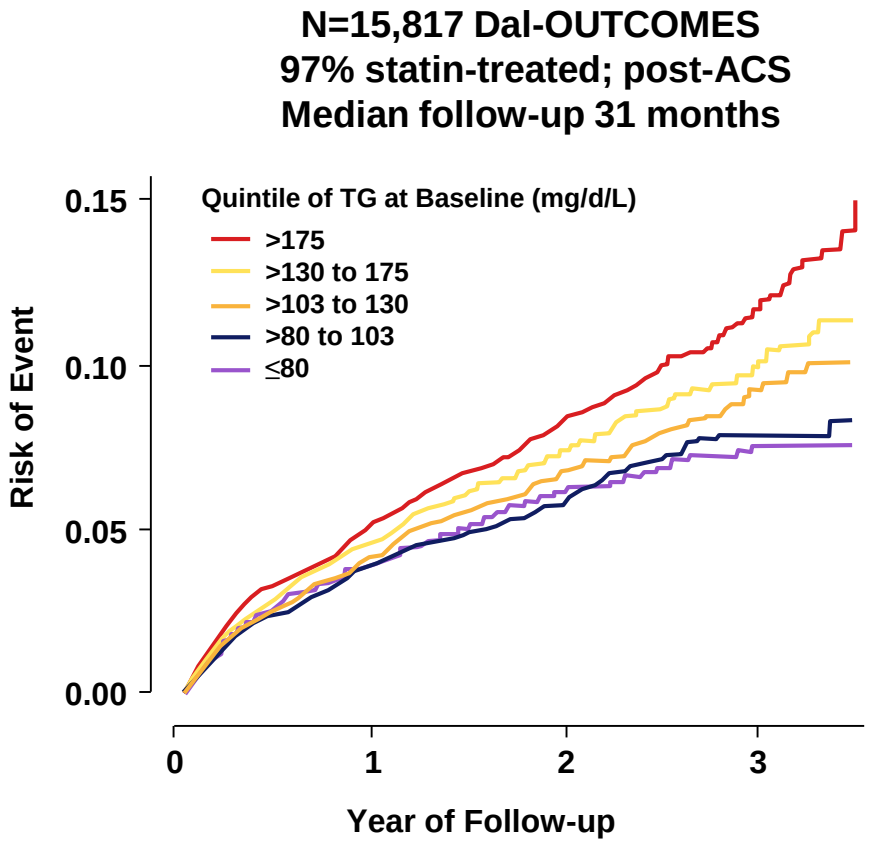
Despite achieving LDL-C <70 mg/dL with a high-dose statin, patients with TG ≥200 mg/dL have a 67% higher risk of coronary events*



*Death, myocardial infarction, or recurrent acute coronary syndrome
†Calculated from adjusted hazard ratio of TG <200 mg/dL (95% CI) = 0.60 (0.45-0.81)
Miller M et al. *J Am Coll Cardiol*. 2008;51:724-30.

On Statin Rx, TG Levels Associate with Short- and Long-term CV Risk





Fasting TG levels are strongly linked to both short-term and long-term major CV event risk on background statin therapy, independent of LDL-C

*P for trend=0.03.

ACS=acute coronary syndrome; HTG=hypertriglyceridemia. Schwartz GG et al. *J Am Coll Cardiol*. 2015;65:2267-75.

Elevated TG (TRL): Drivers of CVD Risk

Lipid Based
Non-lipid Based

Elevated TG: ↑LDL-TG Partially Drives CVD Risk

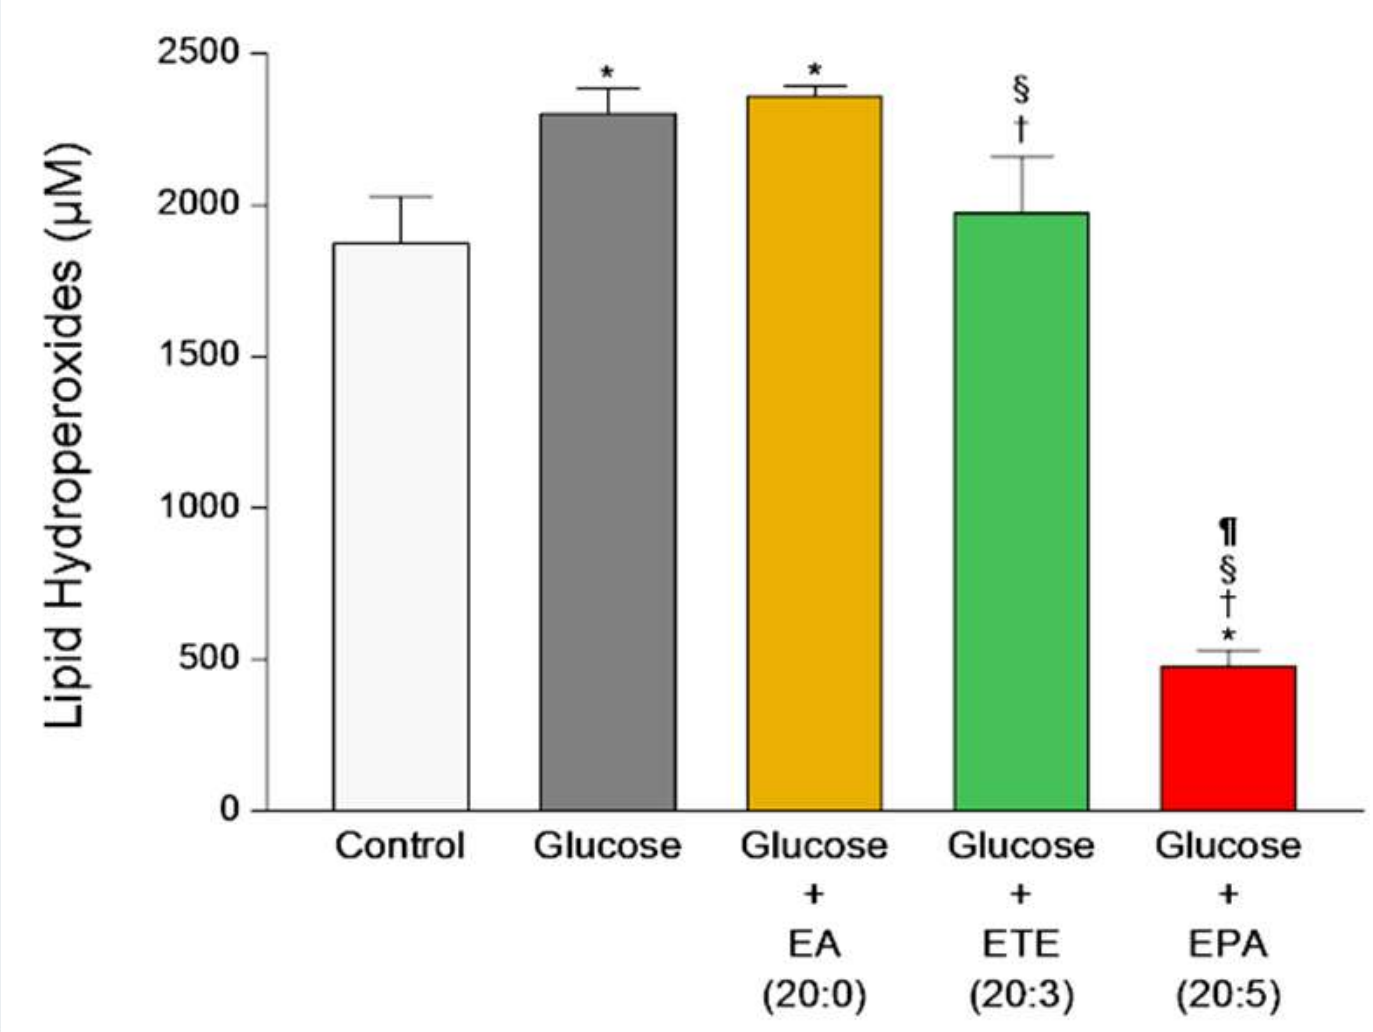
Effect of Structure on Antioxidant Activity of EPA in Membranes

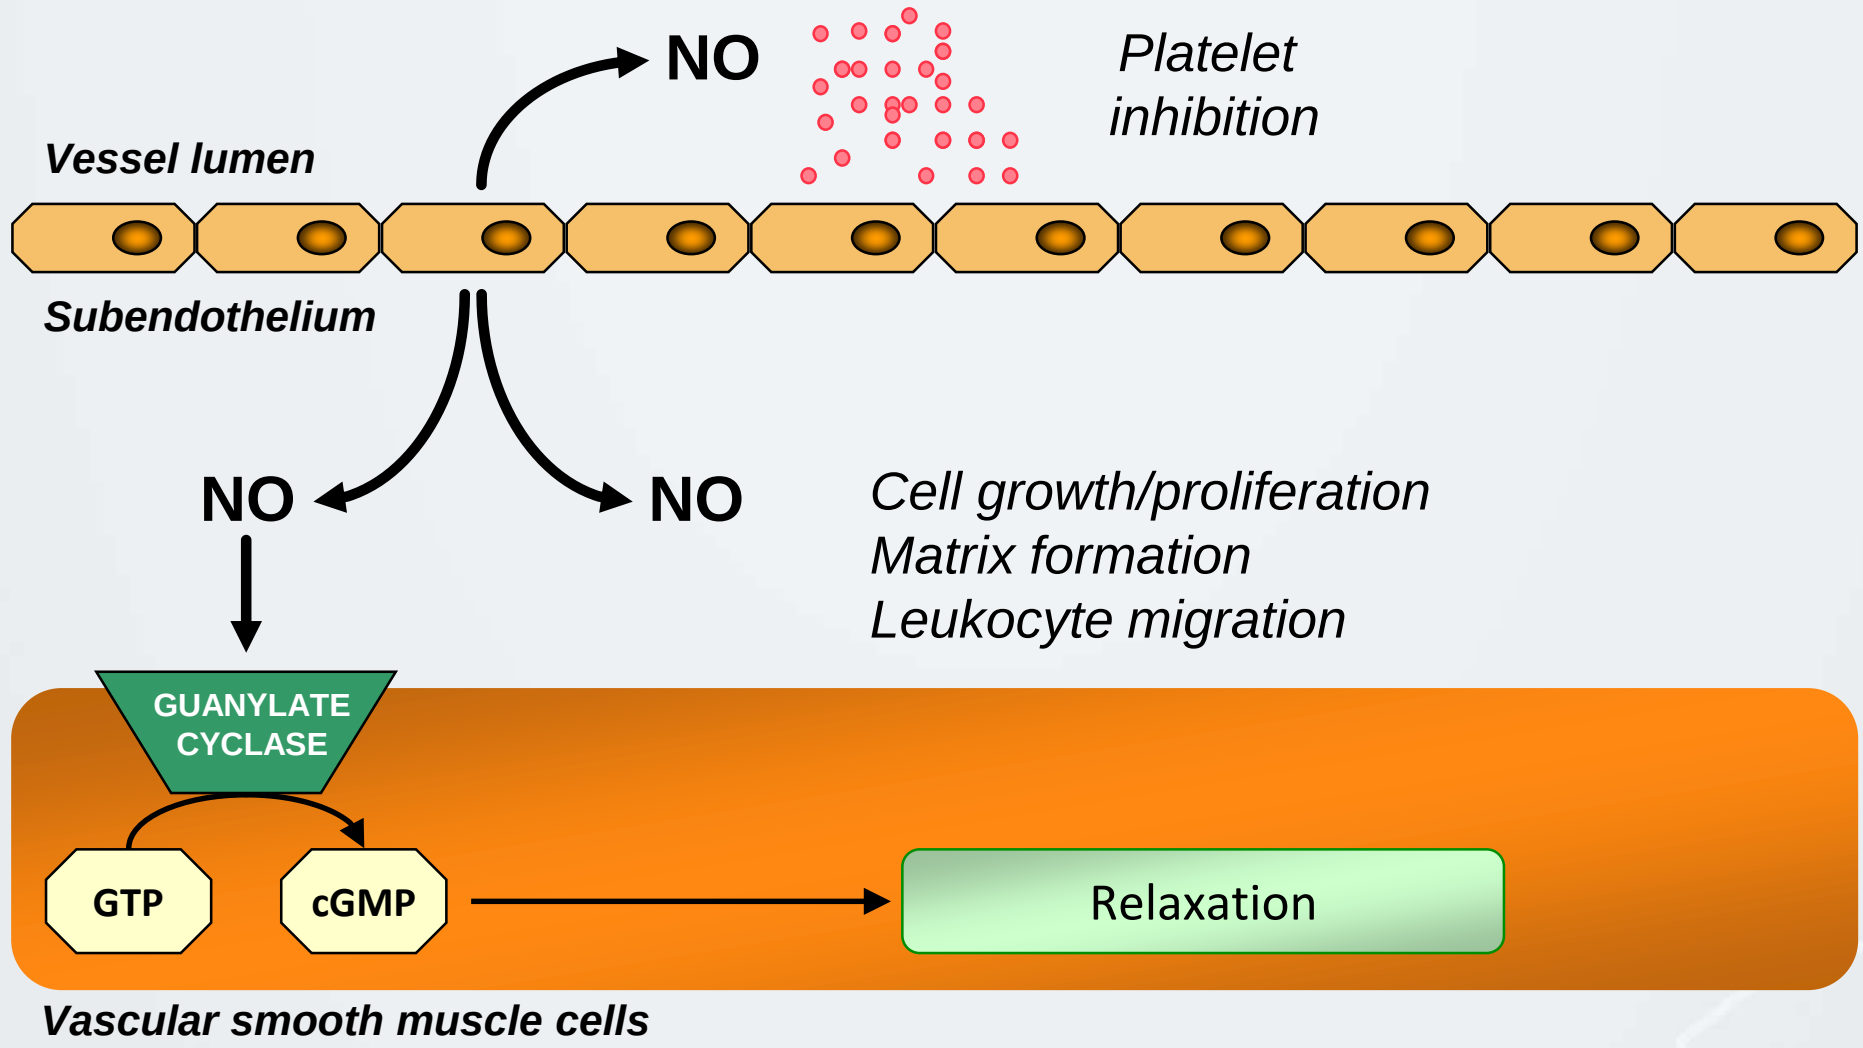


*P<0.001 vs vehicle-treated control. †P<0.001 vs glucose-treated control. §P<0.001 vs EA. ¶P<0.001 vs ETE.
(Student-Newman-Keuls multiple comparisons test; overall ANOVA: P<0.0001, F=248.73). Values are mean ± SD (N=6).

Question 3

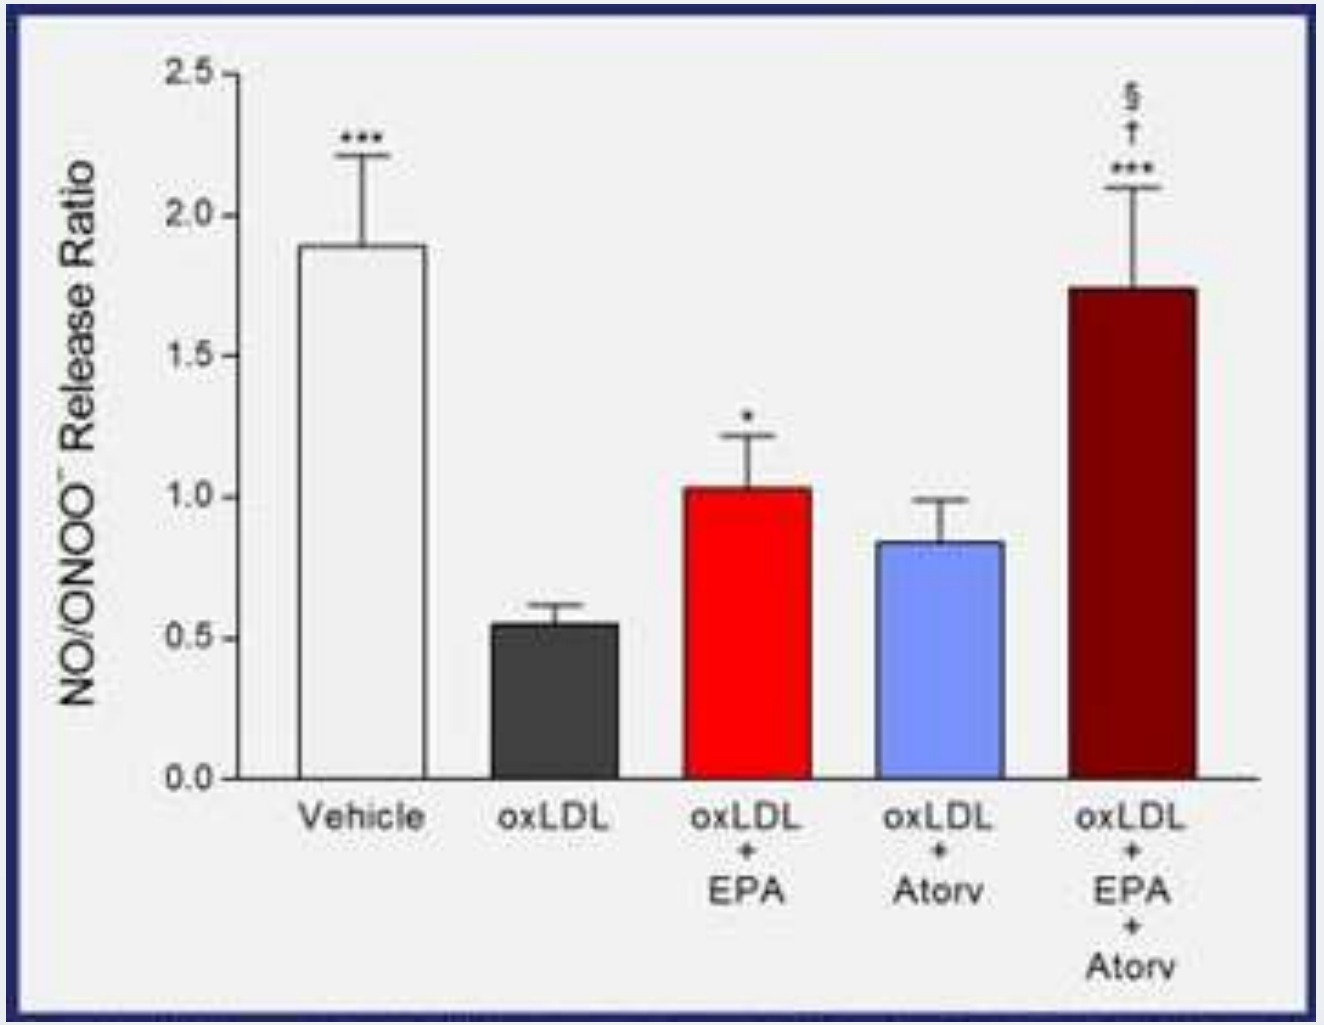
What effects do Omega-3 Fatty Acids and statins have on endothelial dysfunction?

Nitric Oxide Is a Key Mediator of Vascular Protection



Behrendt D and Ganz P. *Am J Cardiol*. 2002;90(10C):40L-48L.
Vita JA. *J Card Fail*. 2003;9(5 Suppl Nitric Oxide):S199-S204.

Combined Effects of EPA and Atorvastatin on Human Endothelial Function after Treatment with Oxidized LDL

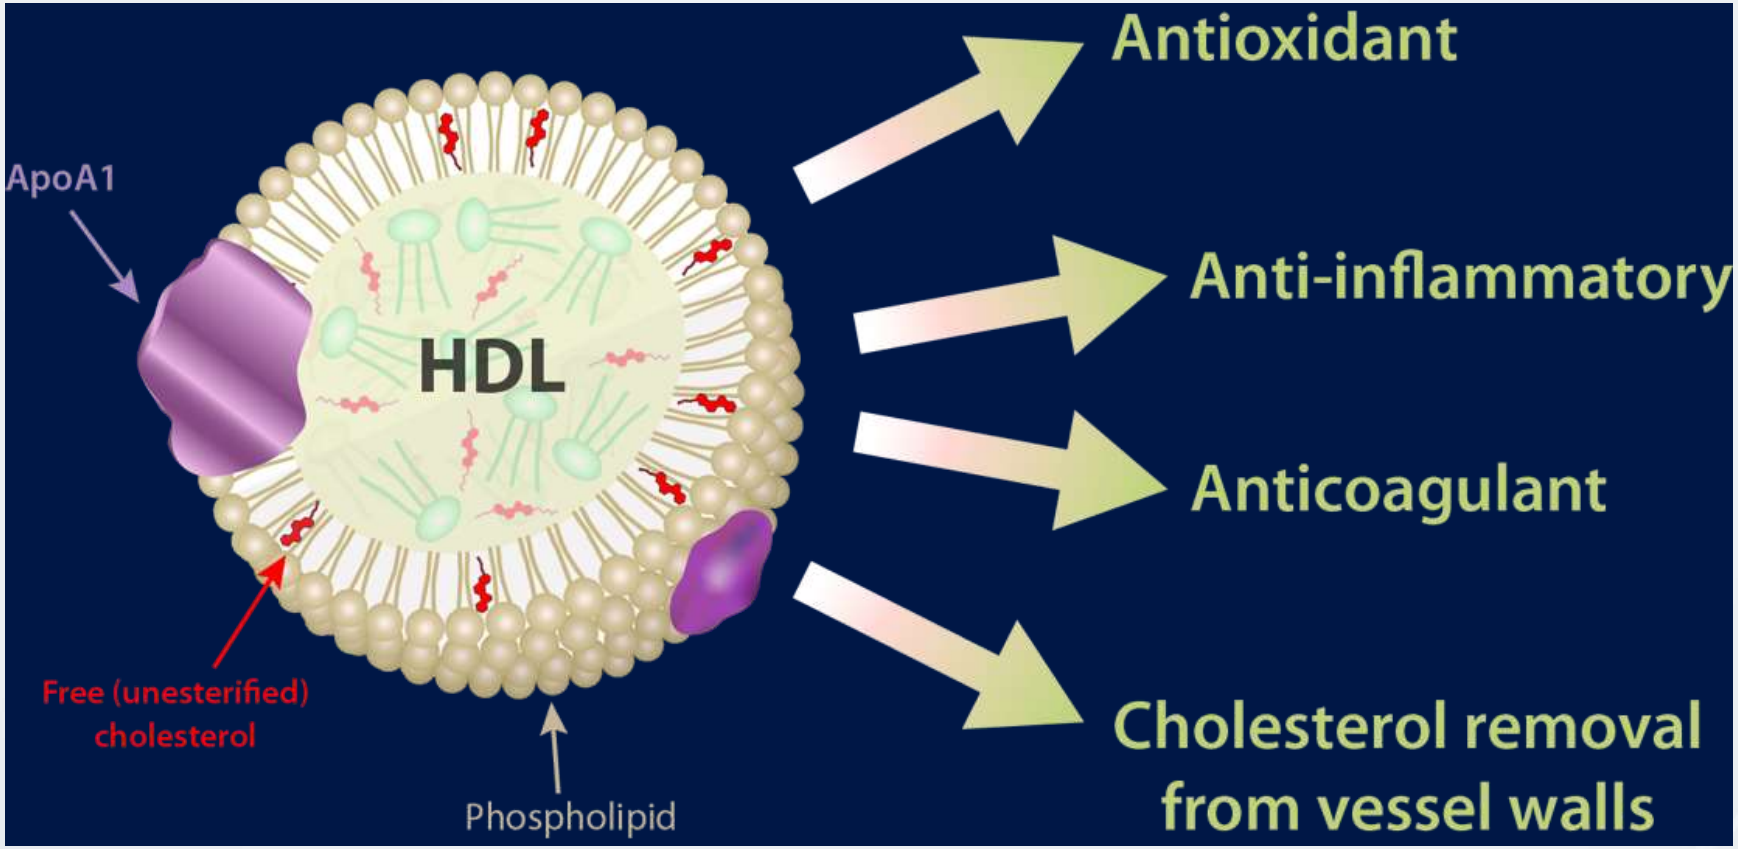


Atorvastatin active metabolite was used in this study. Values are mean ± SD (N=3-6).
*P<0.05 and ***P<0.001 vs oxLDL. †P<0.01 vs oxLDL + EPA. §P<0.001 vs oxLDL + Atorv.
Mason RP et al. *Biomed Pharmacother*. 2018;203:1231-7.

Question 4

*What effects do Omega-3 Fatty Acids and other TG-lowering agents have on **HDL function**?*

Structure and Benefits of HDL



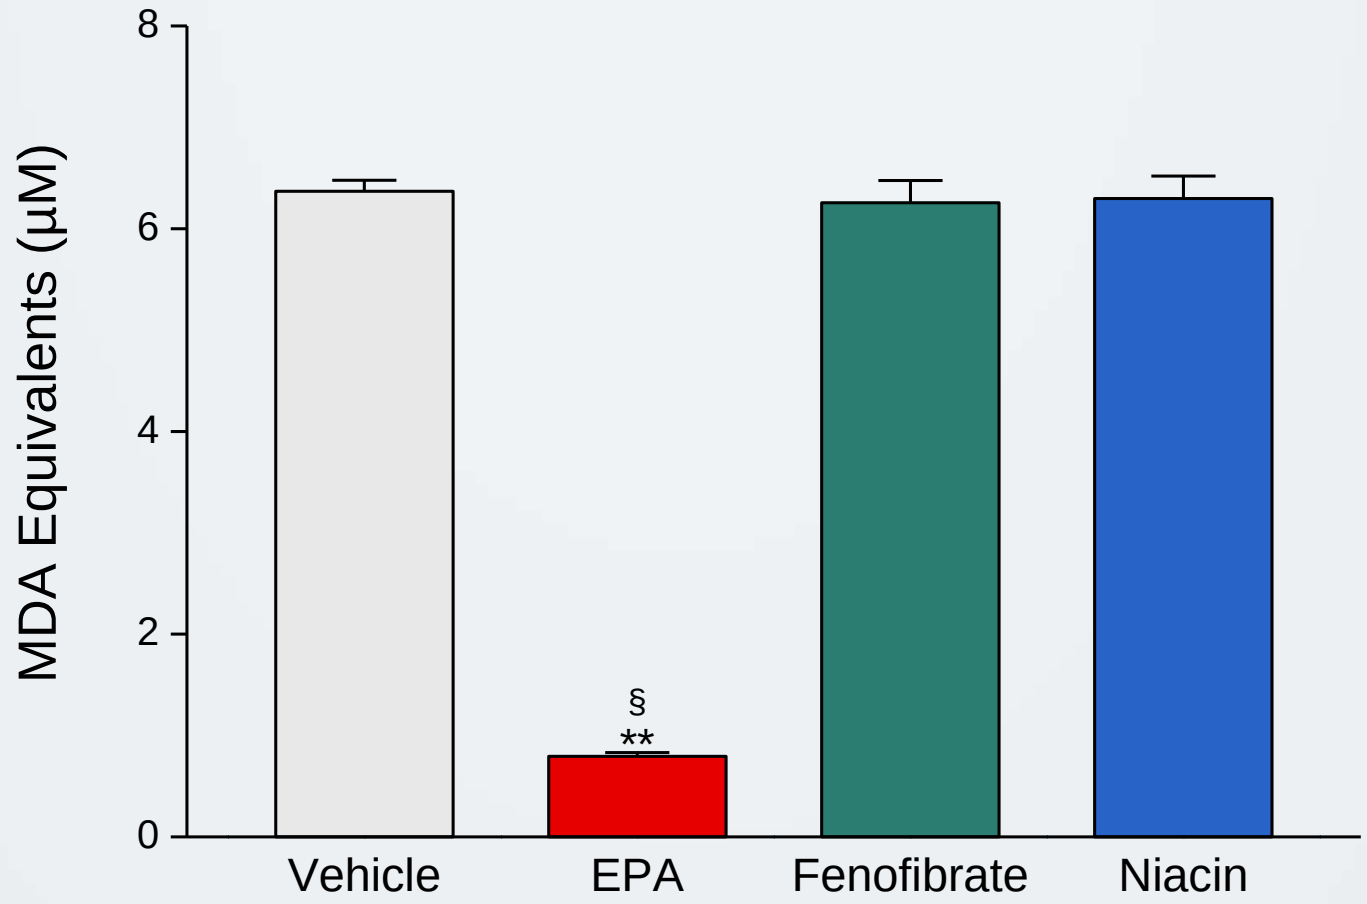
Mason RP and Sherratt SCR. *WCIRDC* Poster Presentation. Burbank, CA. 2018.

Effects of EPA on HDL Function

- Increased HDL-associated PON1 activity
- Enhanced cholesterol efflux capacity in macrophages
- Reduced VCAM-1 expression in endothelial cells
- Increases resolvin E3 production in endothelial cells

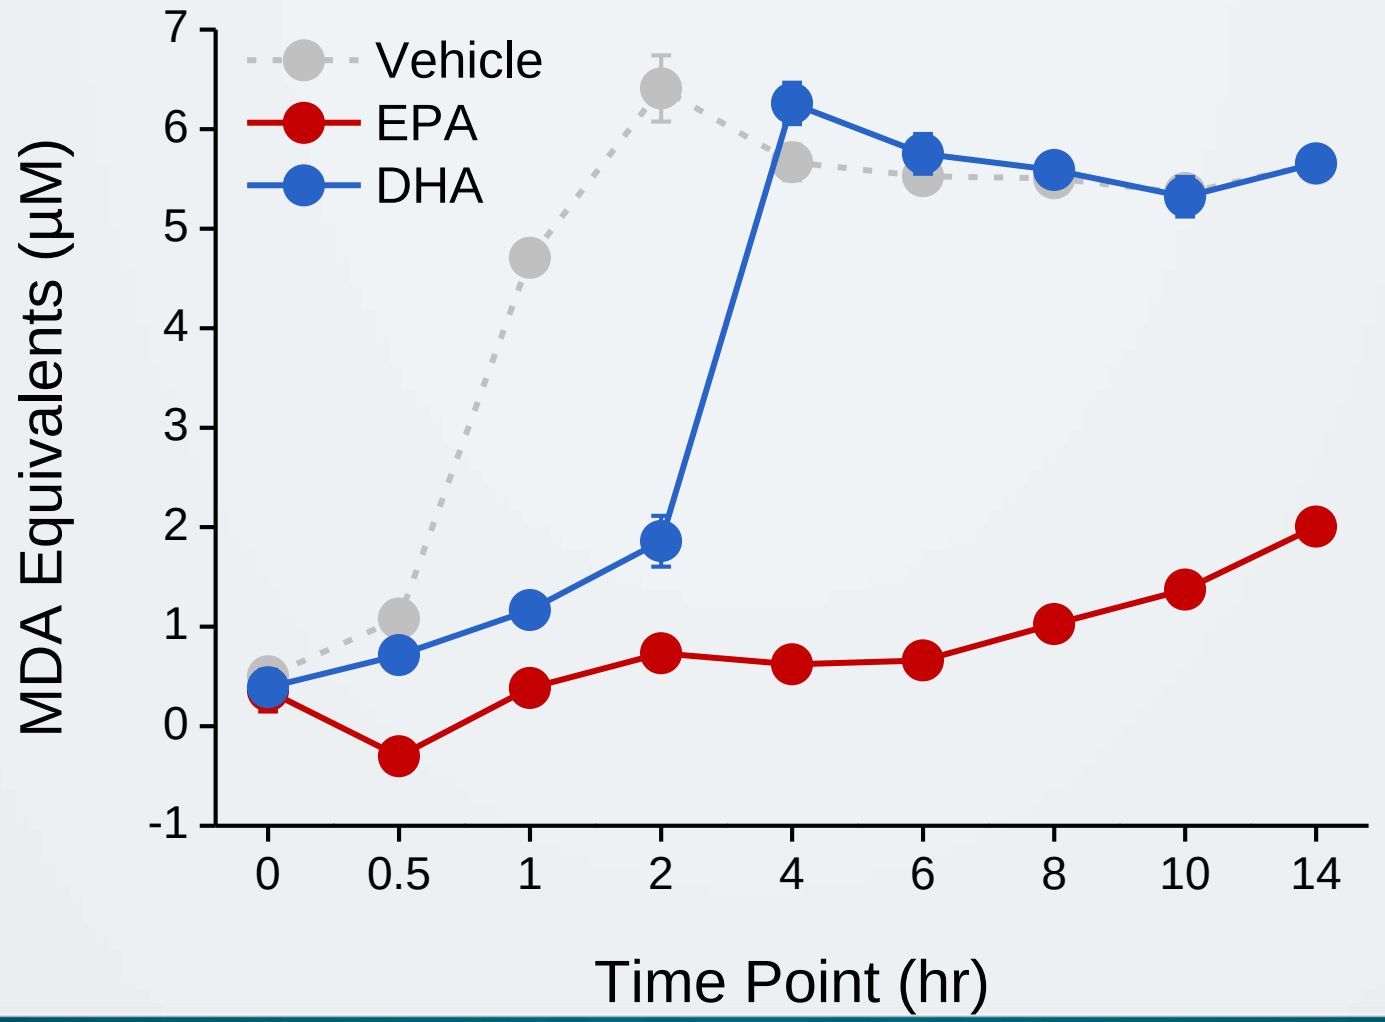
Tanaka N et al. *Atherosclerosis*. 2014;237:577-83.
Tanaka N et al. *Circ J*. 2018;82:596-601.
Sherratt SCR and Mason RP. *Biochem Biophys Res Comm*. 2018;496:335-8.

EPA Inhibits HDL Oxidation as Compared to Fenofibrate or Niacin



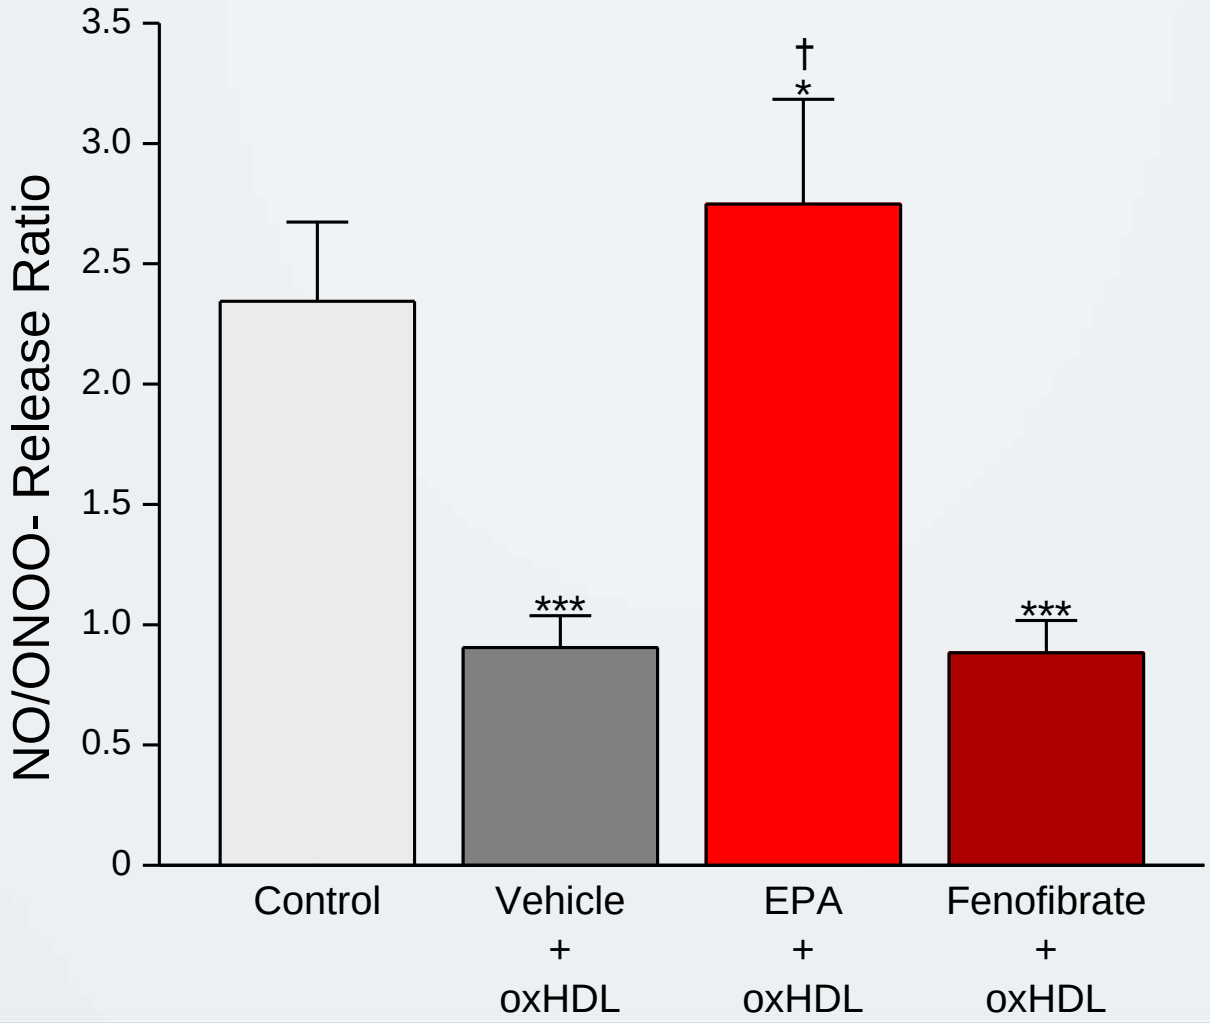
**P<0.001 vs vehicle. §P<0.001 vs Fenofibrate or Niacin. (Student-Newman-Keuls multiple comparisons test; overall ANOVA: P<0.0001, F=833.86).
Values are mean ± SD (N=3).
Mason RP et al. European Atherosclerosis Society. 2018.

Effects of EPA and DHA on Oxidation of HDL



Sherratt SCR and Mason RP. *Biochem Biophys Res Comm*. 2018;496:335-8.

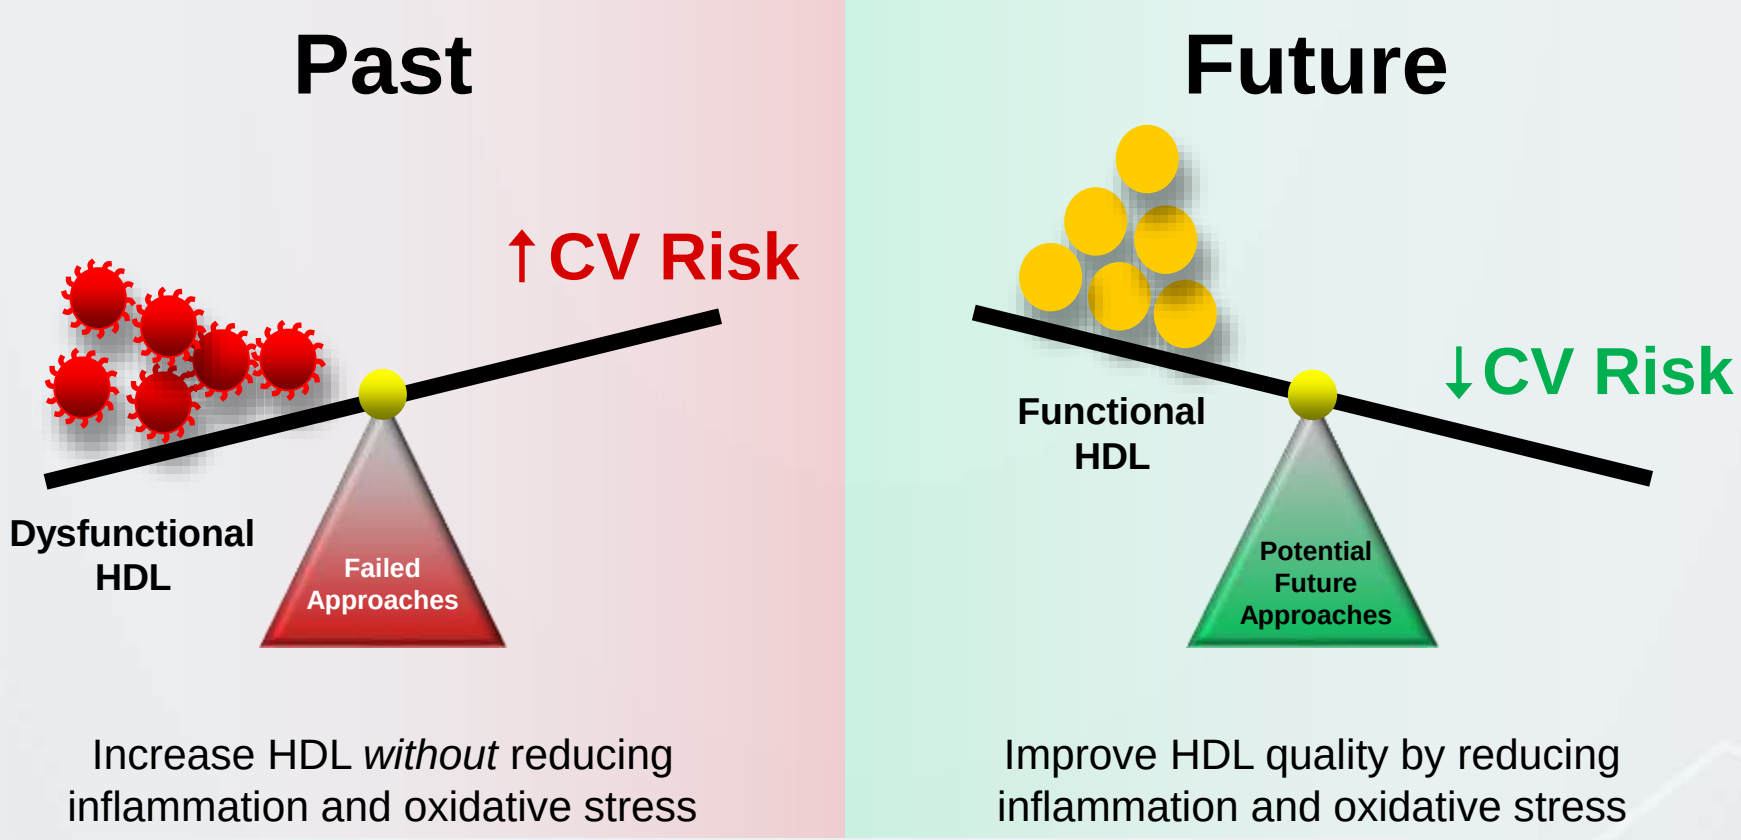
Effect of TG-lowering Agents on HDL Mediated Endothelial Function Following Oxidation



*P<0.05 and ***P<0.001 vs control. †P<0.001 vs vehicle + oxHDL or Fenofibrate + oxHDL.
(Student-Newman-Keuls multiple comparisons test; overall ANOVA: P<0.0001, F=61.063); values are mean ± SD (N=4-6).

Mason RP et al. European Atherosclerosis Society. 2018.

HDL-C as a CV Therapy?



Increase HDL *without* reducing inflammation and oxidative stress

Improve HDL quality by reducing inflammation and oxidative stress

Mason RP et al. European Atherosclerosis Society. 2018.

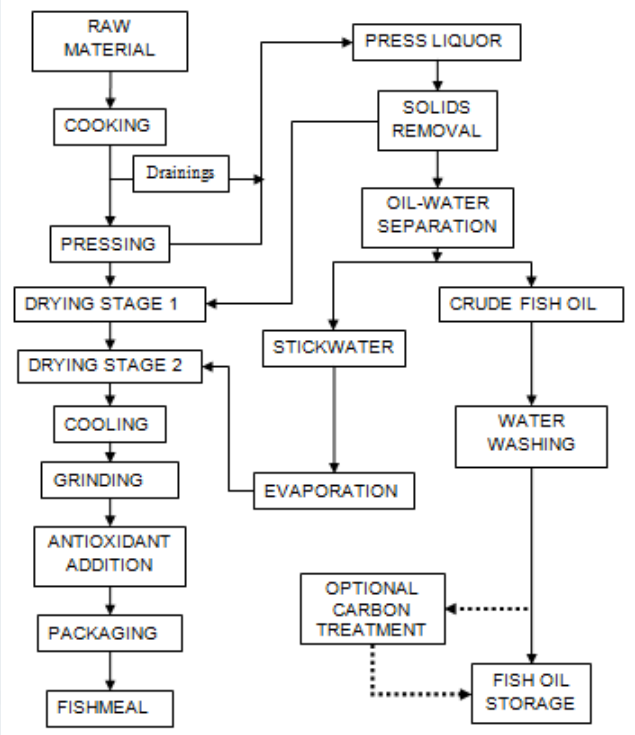
Are Fish Oil Dietary Supplements Appropriate for CV Patients?

Fish Oil Dietary Supplements

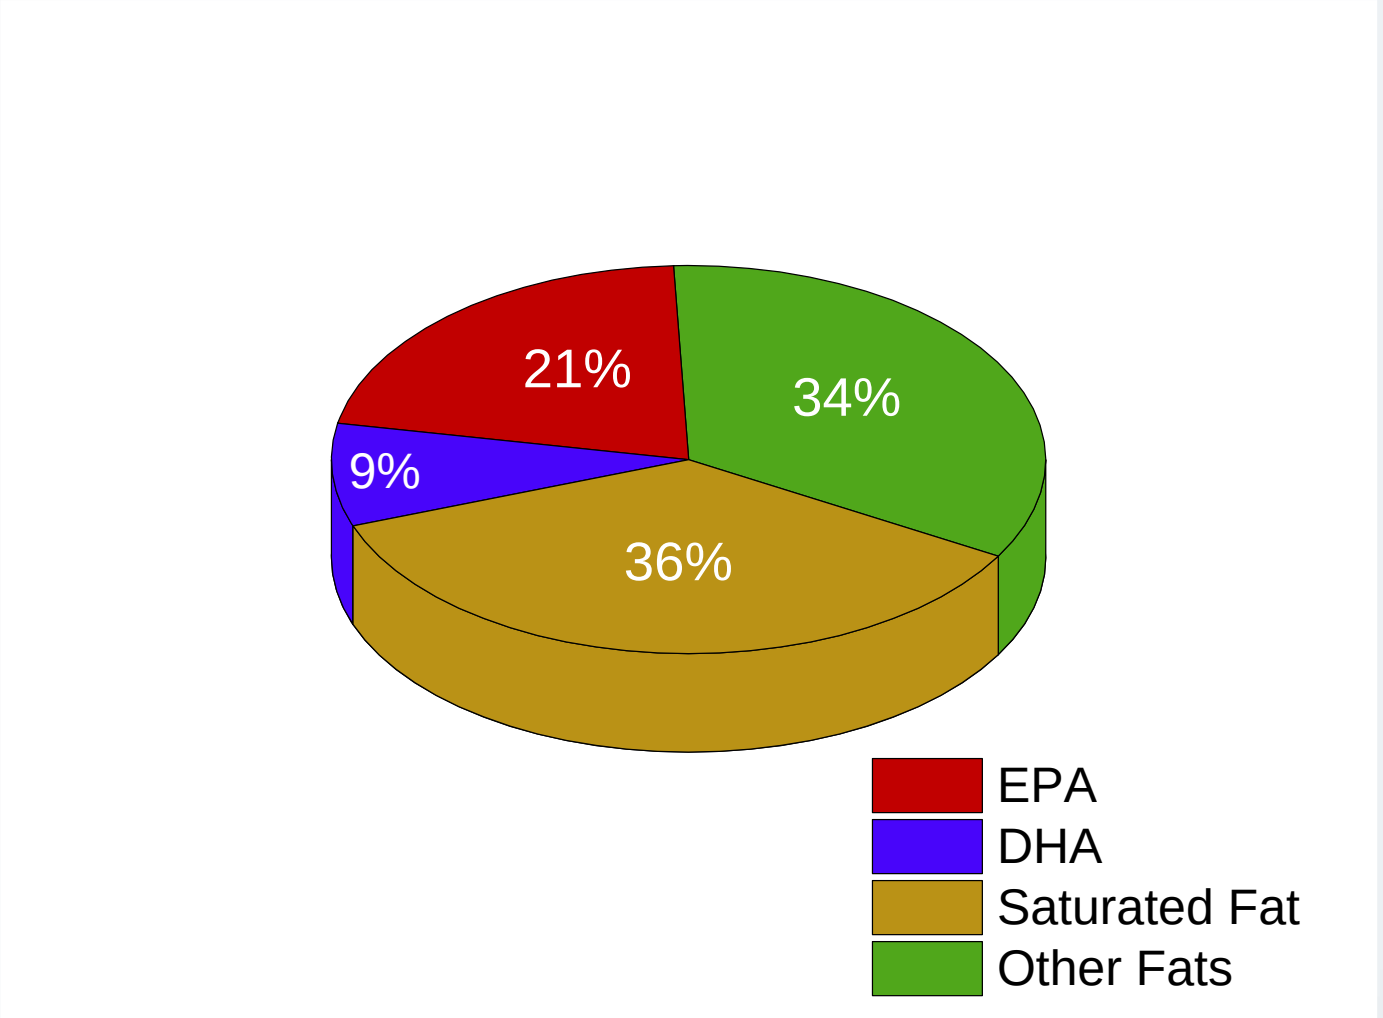
- Leading DS taken by US adults is fish oil[1]
  - 19 million fish oil DS consumed each month[1]
- ~80% of PharmDs and MDs who recommend fish oil supplements think, mistakenly, that they are FDA-approved OTC[2]
  - 30% of PharmDs and 22% of MDs believe Rx and DS are similar in strength and content[2]

1. "Omega-3 Supplements: In Depth". NCCIH. N.p., 2009. Web. 7 Apr. 2016.
2. Fairleigh Dickinson University's Public Mind™ Poll, Omega-3 Physician/Pharmacist Study, March 2013.

Dietary FO Supplements Are a By-product of Industrial Extraction Procedures

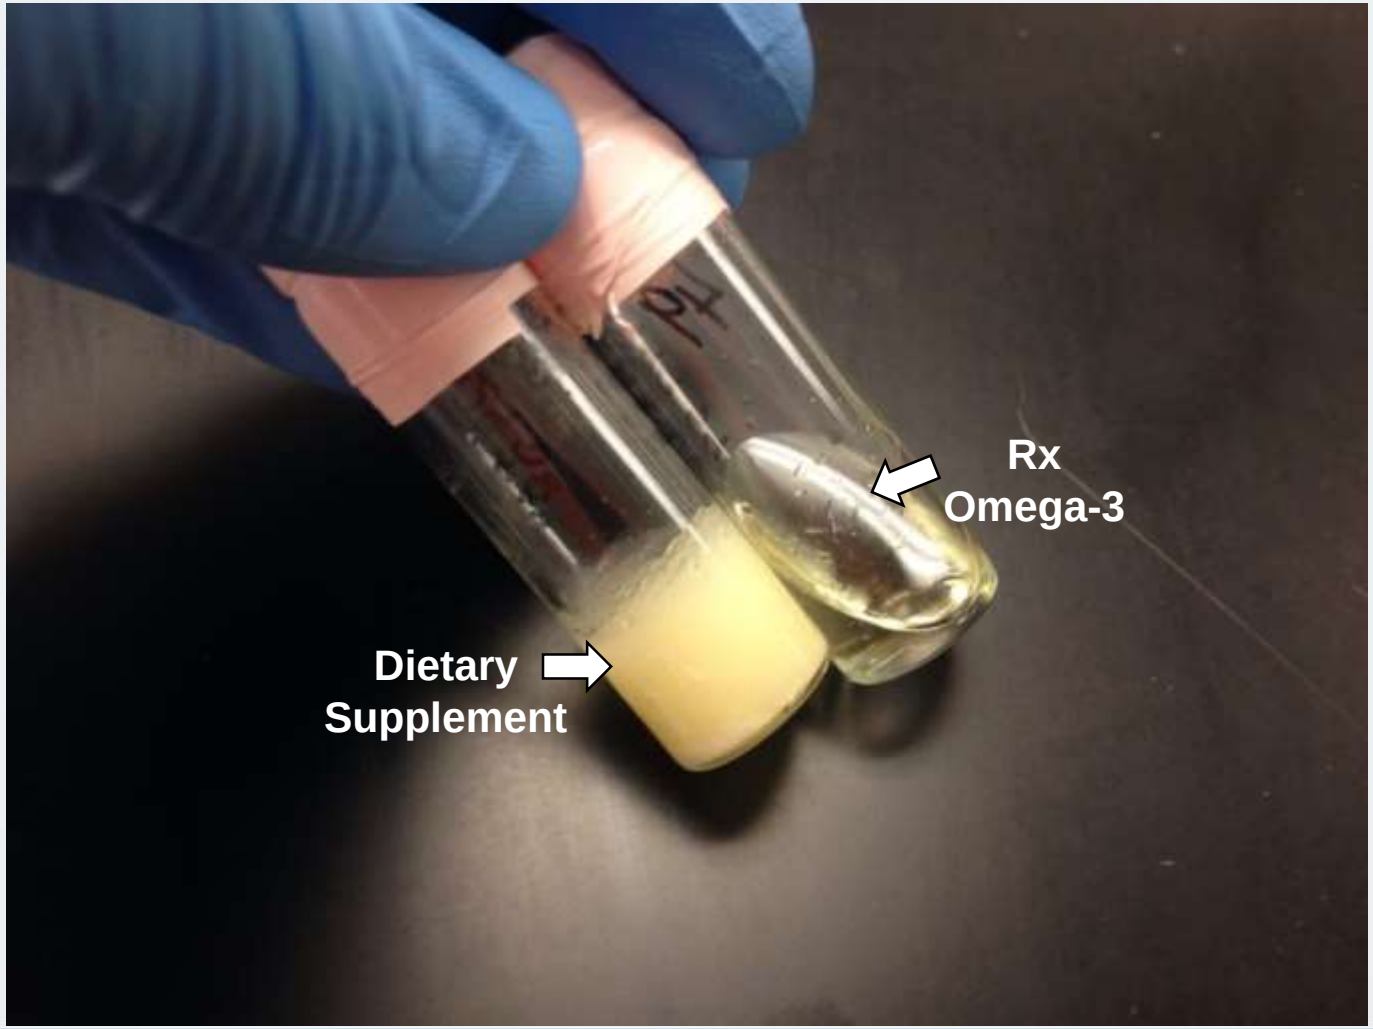


Fatty Acid Content of Leading US Fish Oil Supplement

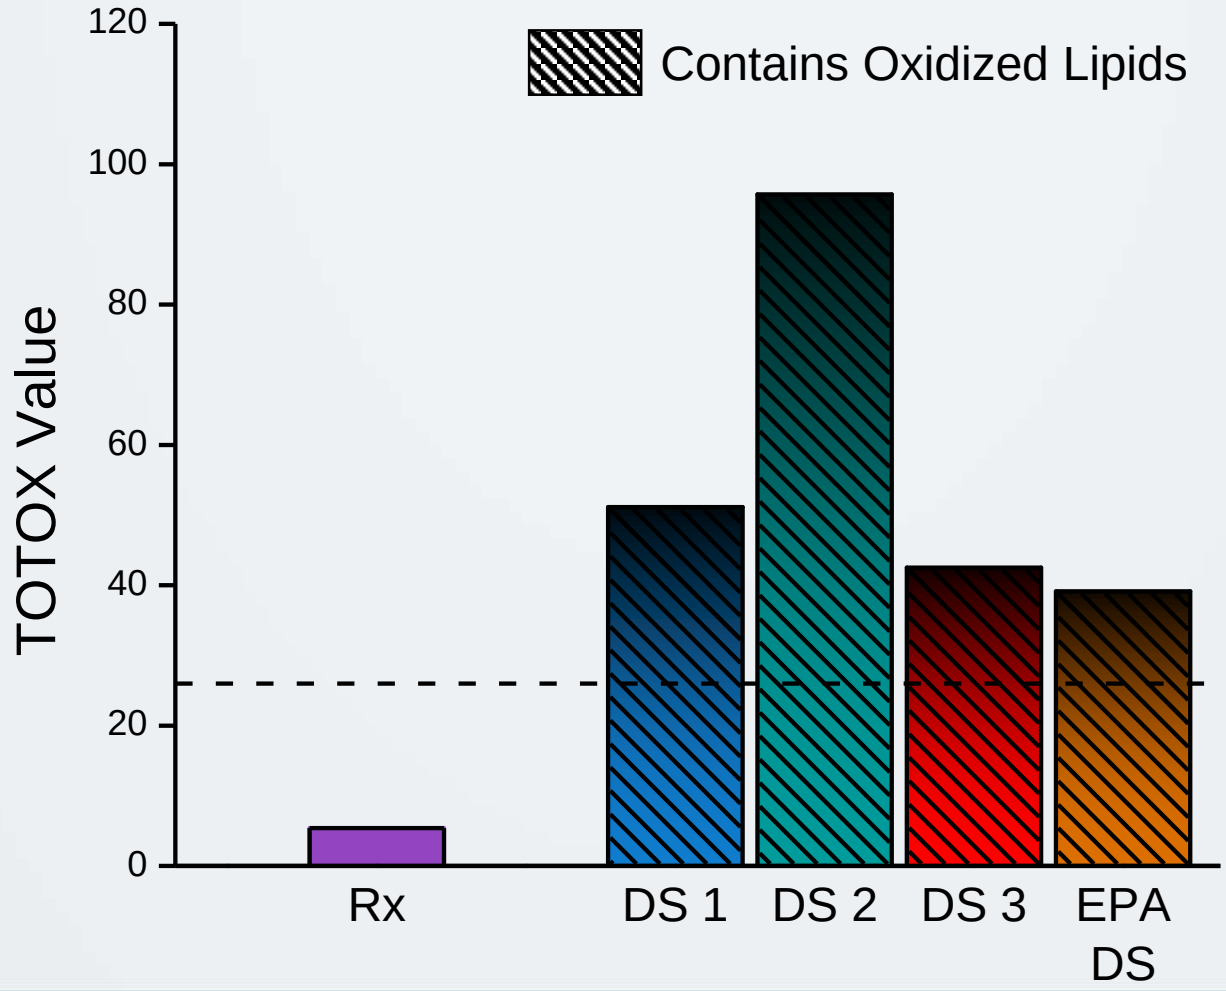


Mason RP and Sherratt SCR. *Biochem Biophys Res Commun.* 2017;483:425-9.

Saturated Fatty Acid Content in Fish Oil Supplement Results in Solid Mass following Isolation



Supplement Total Oxidation Values Exceed International Thresholds



International threshold for oxidation (US Council for Responsible Nutrition. Voluntary Monograph: Omega-3 DHA, Omega-3 EPA, Omega-3 DHA & EPA (2006). Available at: http://www.crnusa.org/pdfs/O3FINALMONOGRAPHdoc.pdf. [Date of access: 09/04/2015].

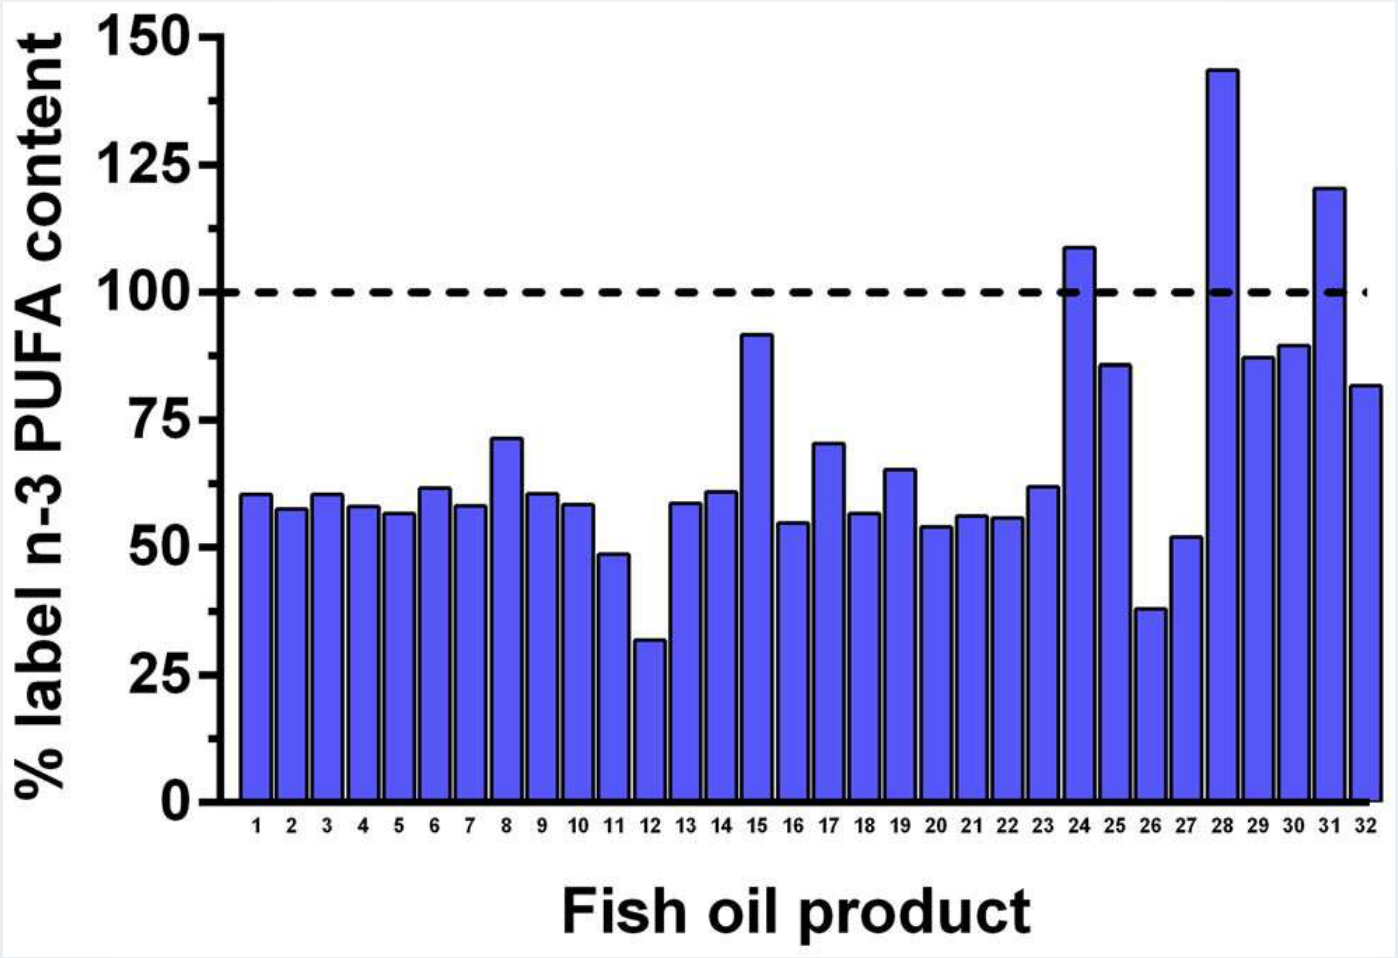
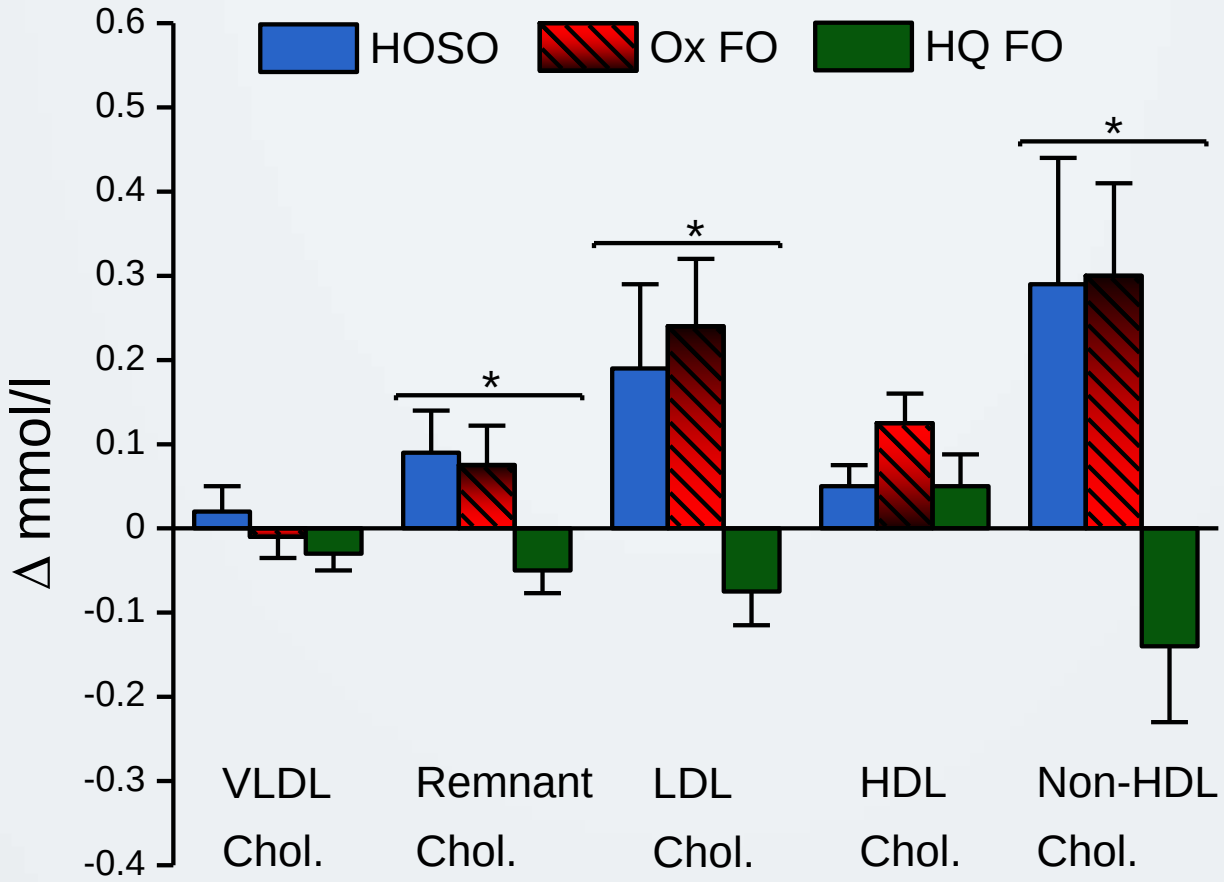
Achieving a Recommended 4 g Daily Dose of Omega-3 with Common Fish Oil Supplements

Fish Oil Supplement Claims Are Inaccurate and Overstate Actual Content



Albert BB et al. *Sci Rep*. 2015;5:7928.

Oxidized Fish Oil Negatively Impacts Key Lipid Factors



PV of 18 mEq/kg and TOTOX 45.Statistical Indicator: *P<0.05. (Values are mean ± SD.)
Source: Rundblad A et al. *Br J Nutr*. 2017;117:1291-8.

Environmental and Processing Contaminants Found in Supplements Are Harmful to Humans

- Heavy metals
  - –Mercury, Lead
- Dioxins, dibenzofurans, dioxin-like polychlorinated biphenyls (PCBs)

"Fish oils extracted from captured marine fish species did not meet the requirements for human consumption…regarding the sum of dioxin and dl-PCB."[1]

[1]Merkle S et al. *Food Control.* 2017;73(Part B):1379-87.

Summary of Fish Oil Dietary Supplements: Right for CV Patients?

FDA Product Classification[1] → Food

Clinical Trials/FDA Pre-Approval[1] → Not Required

Content & Purity[2-8] →
- Difficult to achieve AHA recommended OM-3 levels
- Contain high levels of saturated fats
- Advertised omega-3 content overstated
- Contain oxidized lipids leading to dyslipidemia and increased CV risk
- Contain PCBs and dioxins at levels known to be harmful for humans

Conclusion

- Inflammation, oxidative stress, and endothelial dysfunction are causally related to atherosclerosis;
- Omega-3 FA (EPA) interferes with mechanisms of atherosclerosis at therapeutic concentrations as compared to other TG-lowering agents or omega-3 FA formulations. This may contribute to clinical benefits as seen in REDUCE-IT;
- Dietary supplements are not an appropriate substitute for FDA-approved and tested omega-3 fatty acids in patients.

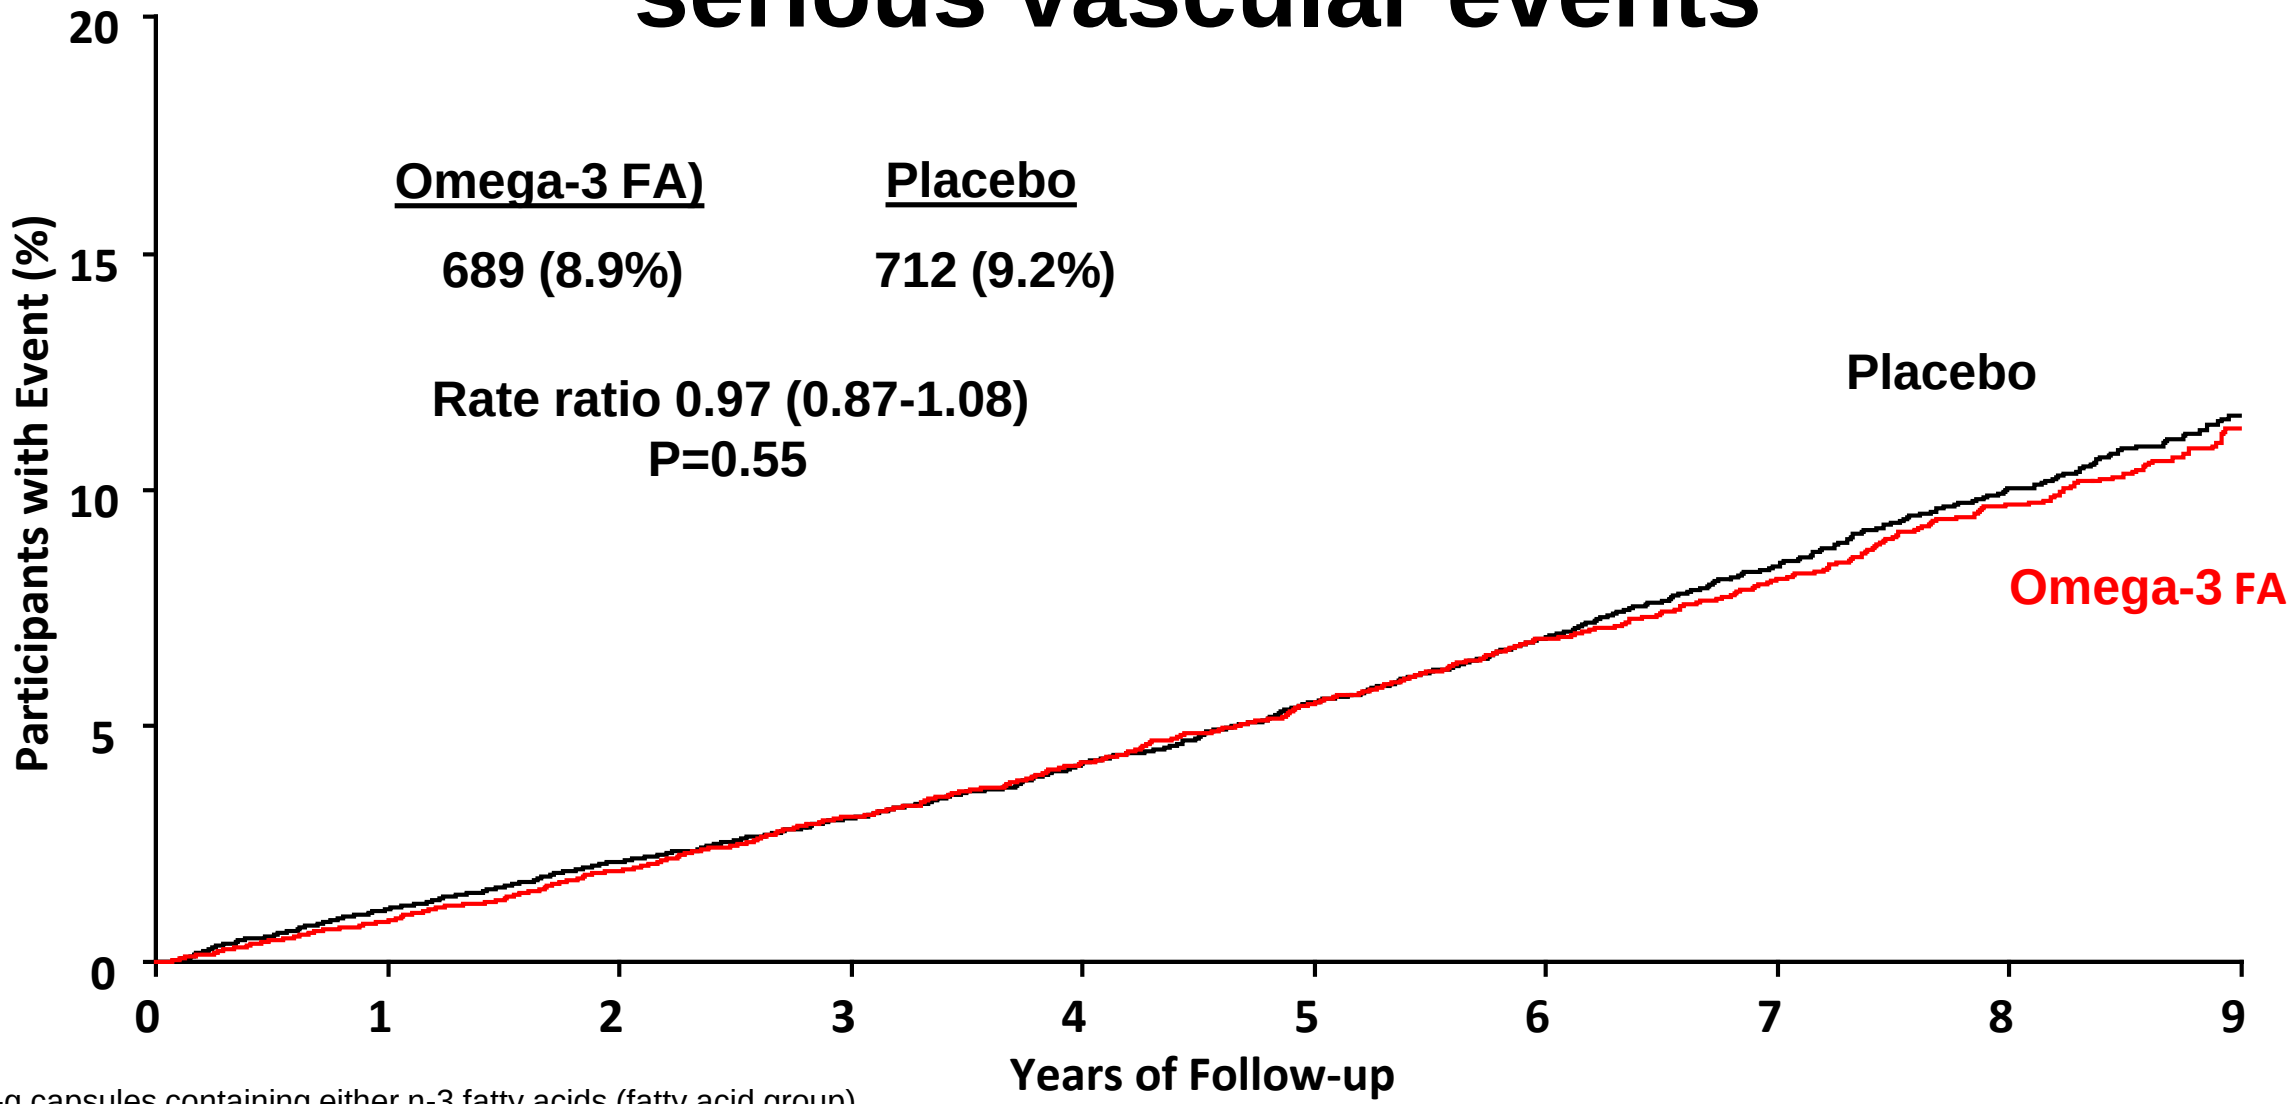
ASCEND trial design

Eligibility:	Age ≥ 40 years; any DIABETES; no prior cardiovascular disease
Participants:	15,480 UK patients
Randomization:	Omega-3 fatty acids 1 g capsule/day vs placebo (and aspirin 100 mg daily vs placebo)
Follow-up:	Mean 7.4 years; >99% complete for morbidity & mortality
Adherence:	Average adherence to omega-3 capsules 77%

ASCEND Study Collaborative Group. Trials 2016;17:286 / Am Heart J 2018;198:135-144

Effect of omega-3 FA supplements on serious vascular events



1-g capsules containing either n-3 fatty acids (fatty acid group)

ASCEND Study Collaborative Group, et al. *N Engl J Med*. 2018;379(16):1540-1550.

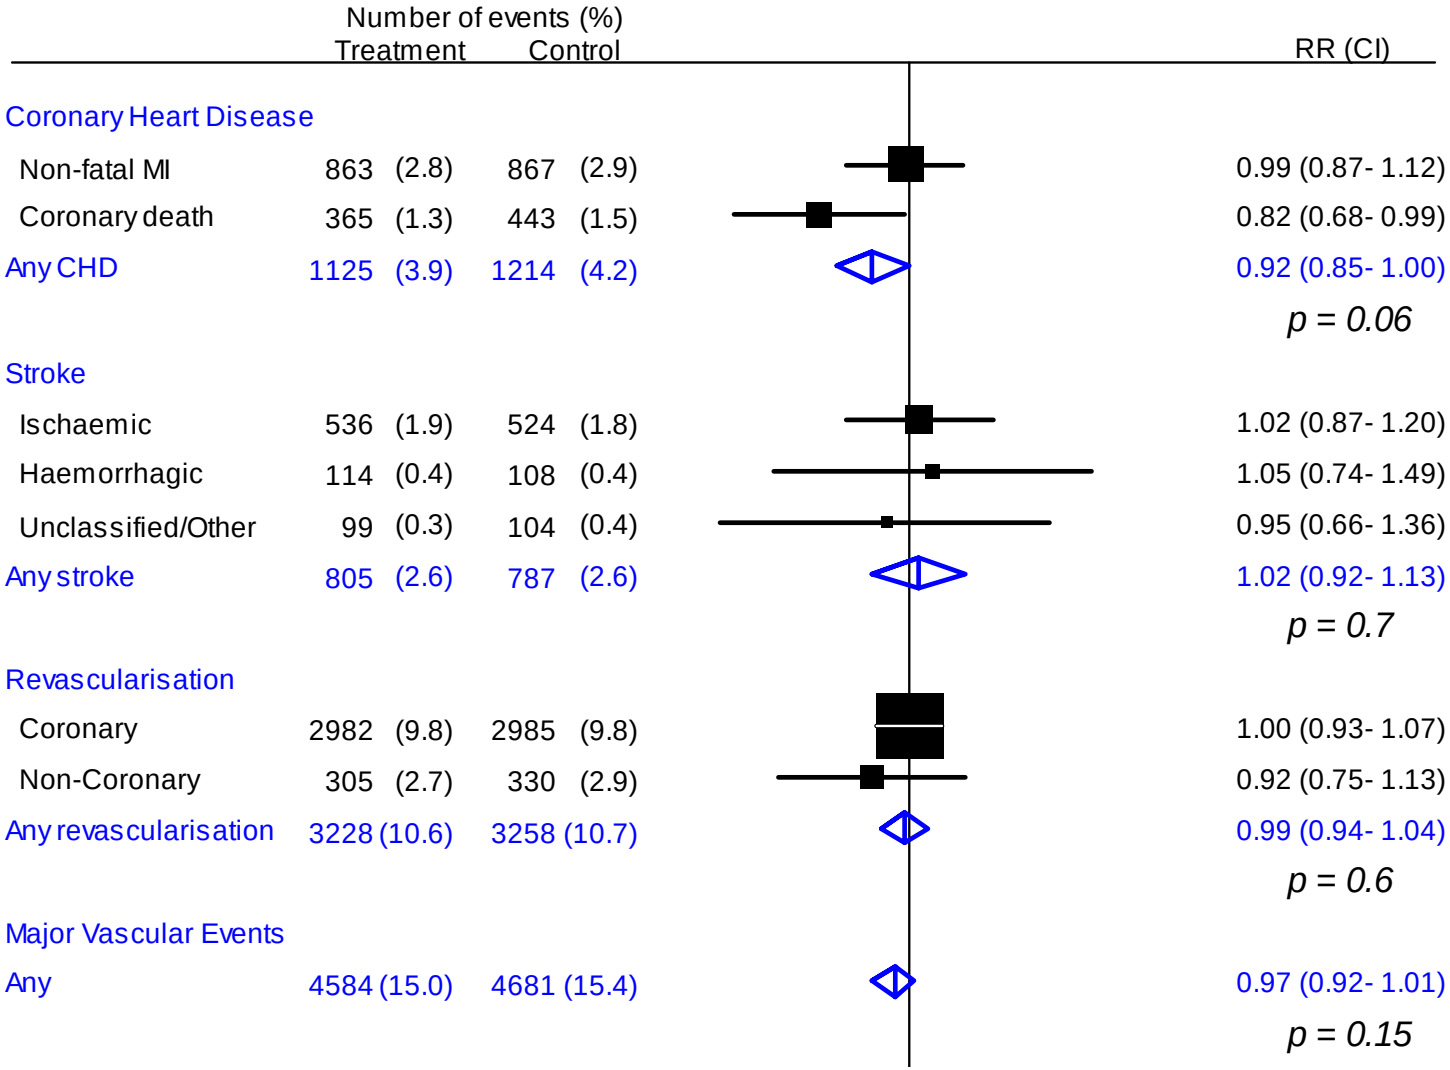
Effect of omega-3 FA supplements

Tabular meta-analysis of large randomized trials
(>500 participants for at least 1 year)

10 trials including 77,917 participants
28,722 (37% with diabetes)

Mean follow-up 4.4 years

ASCEND: 15,480 participants with DM
7.4 years mean follow-up



Fish oil supplements are widely used

- Estimated global market for omega-3 products was $31 billion in 2015
- In a large UK prospective study, 31% of adults reported taking fish oils
- Estimates suggest 7.8% of US population (19 million people) take fish oil supplements
- Benefits claimed on the: heart, brain, weight, vision, inflammation, skin, pregnancy and early life, liver fat, depression, childhood behaviour, mental decline, allergies, bones…

Summary: Omega-3 FA supplementation in diabetes

- ASCEND is the largest and longest duration placebo-controlled randomized trial of omega-3 FA supplementation
- No effect on primary outcome of serious vascular events
- No effect on cancer, total or cause-specific mortality
- No safety concerns
- Guideline recommendations should be reconsidered

The VITamin D and OmegA-3 TriaL (VITAL): Principal Results for Vitamin D and Omega-3 Fatty Acid Supplementation in the Primary Prevention of Cardiovascular Disease and Cancer

- 25,871 participants (primary prevention)
- Median follow-up of 5.3 years
- Major cardiovascular event occurred in 386 participants in the n−3 group and in 419 in the placebo group
  - **hazard ratio, 0.92; P=0.24**

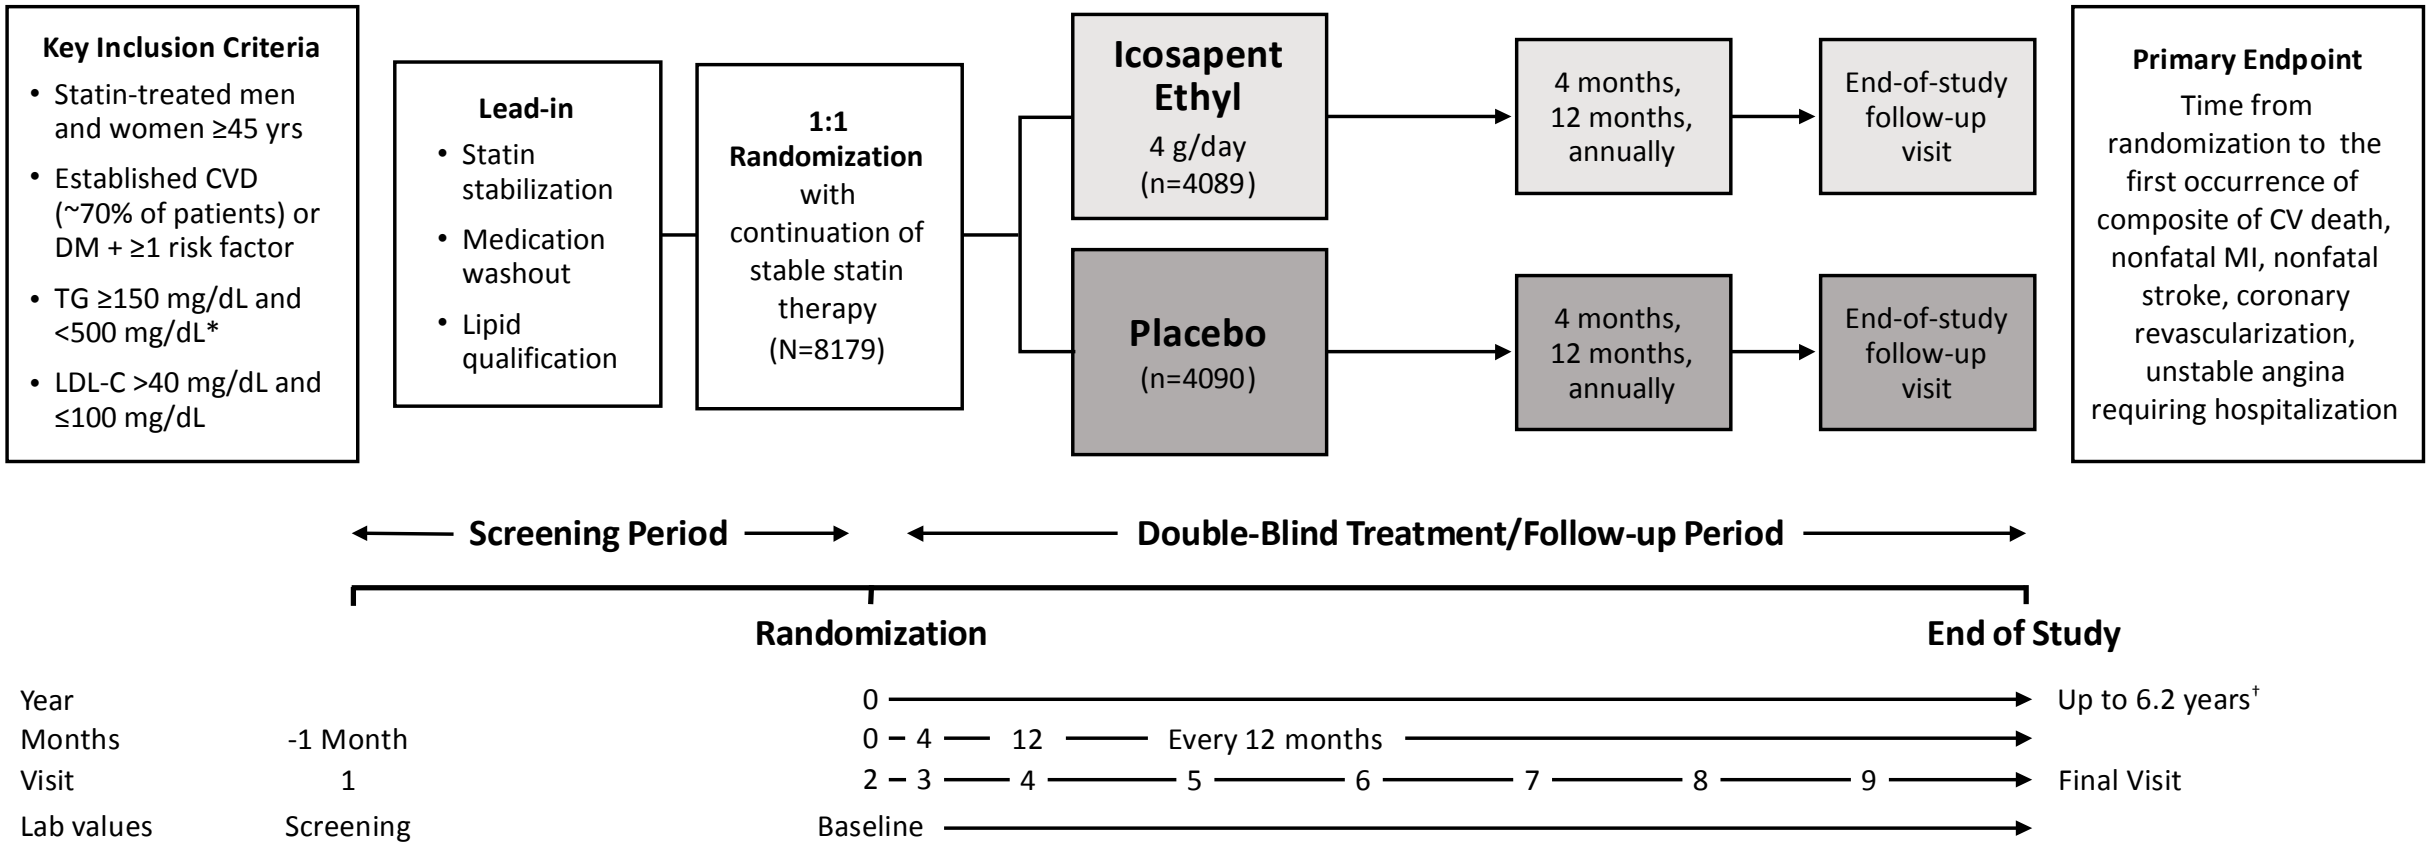
REDUCE-IT Design



* Due to the variability of triglycerides, a 10% allowance existed in the initial protocol, which permitted patients to be enrolled with qualifying triglycerides ≥135 mg/dL. Protocol amendment 1 (May 2013) changed the lower limit of acceptable triglycerides from 150 mg/dL to 200 mg/dL, with no variability allowance.

† Median trial follow-up duration was 4.9 years (minimum 0.0, maximum 6.2 years).

Adapted with permission‡ from Bhatt DL, Steg PG, Brinton EA, et al; on behalf of the REDUCE-IT Investigators. Rationale and design of REDUCE-IT: Reduction of Cardiovascular Events with Icosapent Ethyl–Intervention Trial. *Clin Cardiol*. 2017;40:138-148. REDUCE-IT ClinicalTrials.gov number, NCT01492361.

Key Inclusion Criteria – REDUCE-IT

1. Age ≥45 years with established CVD (Secondary Prevention Cohort) *or* ≥50 years with diabetes with ≥1 additional risk factor for CVD (Primary Prevention Cohort)

2. Fasting TG levels ≥150 mg/dL and <500 mg/dL*

3. LDL-C >40 mg/dL and ≤100 mg/dL and on stable statin therapy (± ezetimibe) for ≥4 weeks prior to qualifying measurements for randomization

*Due to the variability of triglycerides, a 10% allowance existing in the initial protocol, which permitted patients to be enrolled with qualifying triglycerides ≥135 mg/dL. protocol amendment 1 (May 2013) changed the lower limit of acceptable triglycerides from 150 mg/dL to 200 mg/dL, with no variability allowance.

Inclusion Criteria for Secondary Prevention Cohort

One or more of the following:

1. Documented coronary artery disease
   - Multi vessel CAD (≥50% stenosis in ≥2 major epicardial coronary arteries – with or without antecedent revascularization
   - Prior MI
   - Hospitalization for high-risk non-ST-segment elevation acute coronary syndrome with ST-segment deviation or biomarker positivity
2. Documented cerebrovascular or carotid disease
   - Prior ischemic stroke
   - Symptomatic carotid artery disease with ≥50% carotid arterial stenosis
   - Asymptomatic carotid artery disease with ≥70% carotid arterial stenosis
   - History of carotid revascularization
3. Documented peripheral artery disease
   - Ankle-brachial index <0.9 with symptoms of intermittent claudication
   - History of aorto-iliac or peripheral artery intervention

Inclusion Criteria for Primary Prevention Cohort

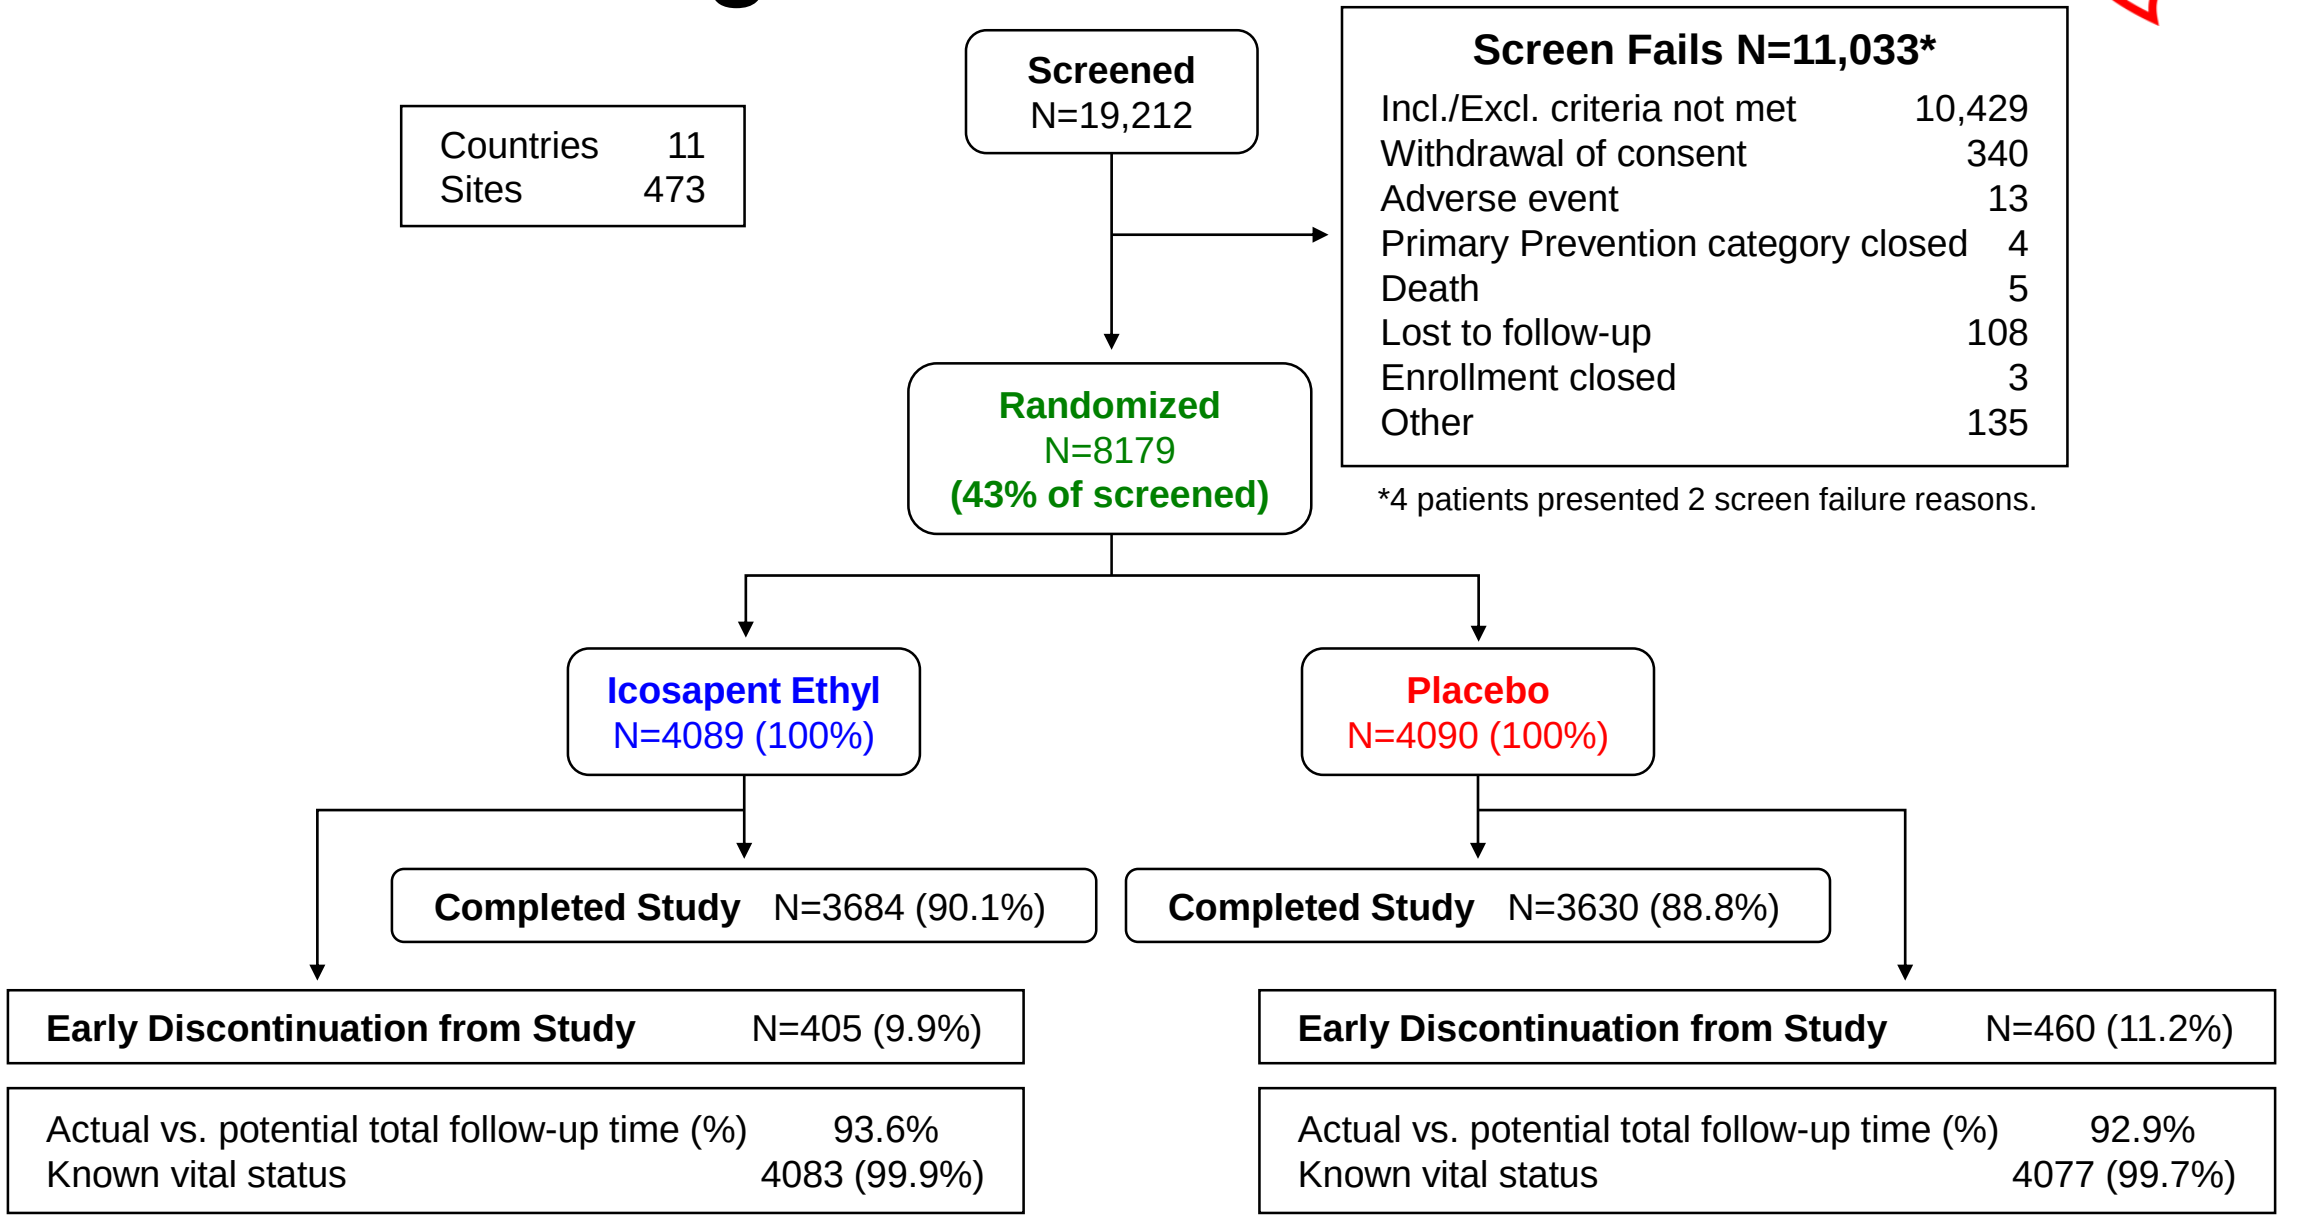
1. Diabetes mellitus requiring medication AND
2. ≥50 years of age AND
3. ≥1 additional risk factor for CVD
   - Men ≥55 years and women ≥65 years
   - Cigarette smoker or stopped smoking within 3 months
   - Hypertension (≥140 mmHg systolic OR ≥90 mmHg diastolic) or on antihypertensive medication;
   - HDL-C ≤40 mg/dL for men or ≤50 mg/dL for women
   - hsCRP >3.0 mg/L
   - Renal dysfunction: Creatinine clearance >30 and <60 mL/min
   - Retinopathy
   - Micro- or macroalbuminuria
   - ABI <0.9 without symptoms of intermittent claudication

Patients with diabetes and CVD are counted under Secondary Prevention Cohort

Key Exclusion Criteria

1. Severe (NYHA class IV) heart failure
2. Severe liver disease
3. History of pancreatitis
4. Hypersensitivity to fish and/or shellfish

CONSORT Diagram



Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Median trial follow up duration was 4.9 years.

REDUCE-IT Tertiary Revasc Endpoints

Revascularization Endpoint	Icosapent Ethyl n/N (%)	Placebo n/N (%)	Hazard Ratio (95% CI)
Coronary	376/4089 (9.2%)	544/4090 (13.3%)	0.66 (0.58, 0.76)
Emergent	41/4089 (1.0%)	65/4090 (1.6%)	0.62 (0.42, 0.92)
Urgent	181/4089 (4.4%)	268/4090 (6.6%)	0.66 (0.54, 0.79)
Elective	194/4089 (4.7%)	278/4090 (6.8%)	0.68 (0.57, 0.82)

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018. Bhatt DL. AHA 2018, Chicago.

REDUCE-IT Tertiary Endpoints: Cardiac Arrest, SCD

Endpoint	Icosapent Ethyl n/N (%)	Placebo n/N (%)	Hazard Ratio (95% CI)
Cardiac Arrest	22/4089 (0.5%)	42/4090 (1.0%)	0.52 (0.31, 0.86)
Sudden Cardiac Death	61/4089 (1.5%)	87/4090 (2.1%)	0.69 (0.50, 0.96)

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018. Bhatt DL. AHA 2018, Chicago.

Treatment-Emergent Adverse Events

	Icosapent Ethyl (N=4089)	Placebo (N=4090)	P-value
Subjects with at Least One TEAE, n (%)	3343 (81.8%)	3326 (81.3%)	0.63
Serious TEAE	1252 (30.6%)	1254 (30.7%)	0.98
TEAE Leading to Withdrawal of Study Drug	321 (7.9%)	335 (8.2%)	0.60
Serious TEAE Leading to Withdrawal of Study Drug	88 (2.2%)	88 (2.2%)	1.00
Serious TEAE Leading to Death	94 (2.3%)	102 (2.5%)	0.61

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Treatment-Emergent Adverse Event of Interest: Serious Bleeding

	Icosapent Ethyl (N=4089)	Placebo (N=4090)	P-value
Bleeding related disorders	111 (2.7%)	85 (2.1%)	0.06
Gastrointestinal bleeding	62 (1.5%)	47 (1.1%)	0.15
Central nervous system bleeding	14 (0.3%)	10 (0.2%)	0.42
Other bleeding	41 (1.0%)	30 (0.7%)	0.19

- No fatal bleeding events in either group
- Adjudicated hemorrhagic stroke - no significant difference between treatments (13 icosapent ethyl versus 10 placebo; P=0.55)

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Most Frequent Treatment-Emergent Adverse Events: ≥5% in Either Treatment Group and Significantly Different

Preferred Term	Icosapent Ethyl (N=4089)	Placebo (N=4090)	P-value
Diarrhea	367 (9.0%)	453 (11.1%)	0.002
Peripheral edema	267 (6.5%)	203 (5.0%)	0.002
Constipation	221 (5.4%)	149 (3.6%)	<0.001
Atrial fibrillation	215 (5.3%)	159 (3.9%)	0.003
Anemia	191 (4.7%)	236 (5.8%)	0.03

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Adjudicated Events: Hospitalization for Atrial Fibrillation or Atrial Flutter

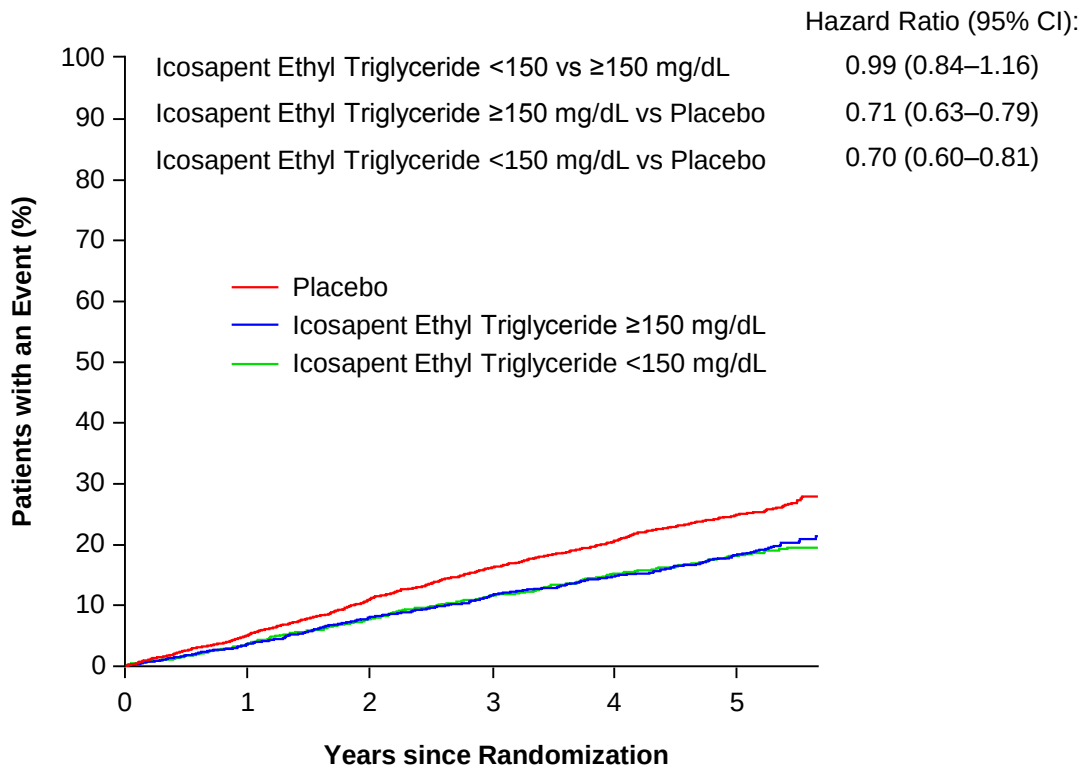
Primary System Organ Class Preferred Term	Icosapent Ethyl (N=4089)	Placebo (N=4090)	P-value
Positively Adjudicated Atrial Fibrillation/Flutter[1]	127 (3.1%)	84 (2.1%)	0.004

Note: Percentages are based on the number of subjects randomized to each treatment group in the Safety population (N).
All adverse events are coded using the Medical Dictionary for Regulatory Activities (MedDRA Version 20.1).
[1] Includes positively adjudicated Atrial Fibrillation/Flutter clinical events by the Clinical Endpoint Committee (CEC). P value was based on stratified log-rank test.

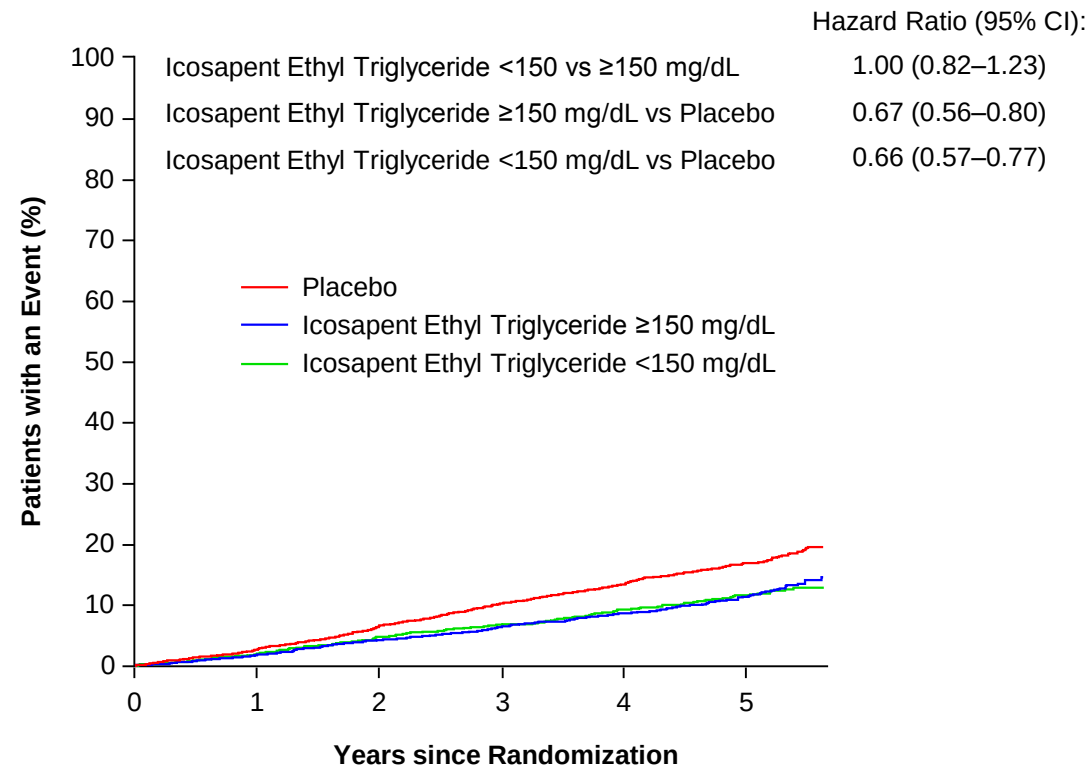
Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Achieved Triglyceride Levels: <150 mg/dL and ≥150 mg/dL

A Primary End Point by Achieved Triglyceride Level at 1 Year



B Key Secondary End Point by Achieved Triglyceride Level at 1 Year



Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Limitations

Few patients on ezetimibe

- Though data appeared consistent in that subgroup

Concomitant PCSK9 inhibitors prohibited

- Though no reason to think they are not additive

Small difference (5 mg/dL) in LDL-C between groups

- Cannot tell from this study if due to drug or placebo
- Would not account for 25% RRR
- JELIS saw 19% RRR in open label design, no placebo
- Consistent benefit in patients with LDL-C ↑ vs no LDL-C ↑

Pending Questions

Cannot comment on mechanisms of benefit from this study

- Consistent reduction across triglyceride range (135-500)
- Similar benefit by 1-year triglycerides < or > 150 mg/dL
- Detailed biomarker and genetic analyses are planned

Cannot comment on cost-effectiveness

- Though with NNT of 21, likely cost-effective
- Formal cost-effectiveness analyses planned
- Full benefits not captured with only first events, await recurrent and total events analyses

Conclusions

Compared with placebo, icosapent ethyl 4g/day significantly reduced important CV events by **25%**, including:

- **20%** reduction in death due to cardiovascular causes
- **31%** reduction in heart attack
- **28%** reduction in stroke

Low rate of adverse effects, including:

- Small but significant increase in atrial fibrillation/flutter
- Non-statistically significant increase in serious bleeding

Consistent efficacy across multiple subgroups

- Including baseline triglycerides from 135-500 mg/dL
- Including secondary and primary prevention cohorts

We thank the investigators, the study coordinators, and especially the 8,179 patients in REDUCE-IT!
